See? You mention it in reply to Jay.

Actually, you only mention size (height and clothing size). You only implied
weight.

My mistake - sorry.

What results?

If the ARRL does have an increase in membership, who is to
say why that increase occurred unless some sort of poll or
survey is done? Membership increase could come from a
bunch of sources:

- Fundraising efforts cause more hams to realize the threats to
amateur allocations
- Increased interest in amateur radio caused by restructuring,
sunspots, economic changes, technology changes and
other changes results in more members.
- Increase in the number of hams results in more ARRL members
>
>> If every single US member of NCI who is not now an ARRL member

>ARRL member to join ... " etc.

Sure. That's what you wrote, but not what I wrote. You ASSUME that
all no-codetest/slowcodetest amateur would side with you. That's not
a valid assumption at all.

Right in this newsgroup there are hams who supported the end of
13 and 20 wpm testing but think total code test elimination is a bad
idea. At least one regular poster here says he quit NCI because he
thought 5 wpm was the right amount of testing.

>I don't believe I limited the target
>population to NCI members.
>
The number of nocode international members is known (at least to some).
The number of amateurs opposed to code testing is not known.

>voted for same.

Sure - IF they ALL supported the no-code-test agenda. That's not
a valid assumption at all. It's your wish, nothing more.

Equating the set of hams who have not taken code tests beyond 5 wpm
with the set of hams who want code testing totally abolished is not
logically valid.

Arnie,

I don't think most of the BoD want their votes to be widely known.

The policy change was not done by a recorded vote. Their was a motion to have
a roll call/recorded vote, but it was not approved. Which means most of the BoD

did not want their votes on the policy change recorded.

All of this is in acordance with the bylaws and paliamentary procedure. But one

has to wonder WHY a director would not want his/her vote recorded, if they
really believe in what they voted for.

PACTOR II takes up approximately the same bandwidth as CW. It has
higher throughput and better signal to noise capabilities than CW.

But don't you see the difference between saying it that way, and the way you said it before? One is accurate, and the other is purely derogatory. You almost always opt for the derogatory. That's what makes a lot of what you say so irritating.

I'm seriously confused. If the CSCE for the code was current and
presented when the CSCE for General element was awarded, the VEs
would've filed both CSCEs with the FCC, resulting in the issuance of
the General license. I don't believe you need to send it to the FCC.
What am I missing here? You have "unfiled" CSCEs for code and the
General element? Is it that the code CSCE had expired when the General
element was passed? In that case, filing the code CSCE would do no
good. For all intents and purposes, you still need to pass the code
again. Notice, I am not judging your reasons, just trying to figure
out the sequence.

I believe FCC pretty well addressed that situation with the rule that says in a
life threatening situation "anything goes".

>> one or two Special Forces MOSs require it.
>>
>Heck, it took me about six months to get you to admit that SF even required
>their troops to know Morse.

Wrong again. The original subject thread concerned MORSE IN MILITARY COMMUNICATIONS. Communications of the two-way kind.

I stated, on the basis of early experience and periodic later observation, that the U.S. military had GIVEN UP ON MORSE for tactical or routine military communications. That was re-enforced by giving several web addresses for information on current (as of 1984 and later) publicly-available documentation on signal equipment in-use by the U.S. military land forces.

There was a long off-shoot of that thread concerning the SINCGARS family of small-unit (squad to battalion, ground-air support) radios which are coming up on 14 operational years in service. SINgle-Channel Ground Air Radio System has voice and data modes, in-clear or encrypted, but no OOK morse modes. Earlier, in another thread, I had pointed out that portable equipment operating in the military aviation band (225-400 MHz) was PROBABLY in use "behind the lines" in Kuwait-Iraq during the Gulf War for the reason that it could link with airborne relay craft or satellites, sending data at up to 1200 Baud with VERY low probability of intercept due to very directional antennas and the capability of pointing UP rather than spreading all the RF horizontally.

Somewhere in that convoluted timeline Macy jumps in with making a Big Deal of "special forces 'Using' morse" as if that is the exception disproving the regular routine or tactical military communications modes not using morse.

Since Macy is a proponent of morse he had some kind of burr under his shoulder holster about any PUBLIC, FACTUAL information that did not support the morse myths. Macy kept harping about "check out the MOS requirements" and kept

insisting that I should call long-distance to some name and
rank to "prove that special forces need to know morse," etc.

I DID agree that (through checking elsewhere through public-
access information Army sources) ONE special forces MOS
requires morse ability. Macy then tried to manuever the sub-
thread into my "insistence that I disagreed with him" and
"would not admit to Macy being right (about SF)."

In the larger context of the thread, I STILL DO NOT AGREE
WITH MACY on the U.S. military USING MORSE MODES
FOR TACTICAL COMMUNICATIONS. They don't. The
tactical and strategic doctrine for special forces are NOT
PUBLIC IN THEIR ENTIRETY nor should they be.

>I *never* said it was vital to their
>operations, I said it was required of the Communications Specialists.

In the words written in here, yes. In the implication that BECAUSE
the SF (in one MOS) require morse ability, the U.S. military uses
morse modes, that is a piece of MISINFORMATION. If that is too
strong a charge, call it "guilt by omission." And there is a LOT of
omission in trying to use ONE MOS as some kind of exception
to what signal units in all branches have been using for decades.

>... You just continue to make it up
>as you go trying to fit those round thoughts into a square hole. Nothing
>has changed with you.

I am simply pointing out publicly-available information sources that
are available to anyone, even radio amateurs (the Army TM on
inventory of signal equipment is linked on at least two ham-oriented
websites). I don't post long-distance telephone numbers and demand
that others call it (at their charge) to "prove" a posting. I prefer to let
others see the evidence at their leisure and make up their own mind.

I gave the website to Fort Huachuca in here, explained that the M.I.
school there trains all government personnel in morse cognition,
even mentioned the specific unit down to the company level. All from
their website (an interesting one if one is into M.I. data). From their
website information (open to the public) they have the number of
students per class, the number of classes for the year, a summary
of the particular courses. It's fairly easy to see that the total number
of students will exceed the number of morseMOS troops in the
special forces. [Macy may disagree with that but TS, baby]

Now, let me level a charge against Macy: As a civilian employee of
the Department of the Army, Macy has easier access to information
on communications methods, equipment, and personnel than most
other newsgroup participants...whether it is classified or released to
the public. Macy has NOT MENTIONED ANYTHING about accessing
such information. NOTHING. Not even the websites provided in here
by myself and others. Yet the public, civilian defense contractors,

manufacturers, sellers and buyers of military equipment can all access public information on U.S. military equipment, personnel (full Army MOS precis from one site, course materials at Fort Gordon at another!).

All of the above will indicate (without reasonable doubt) that morse methods are GONE from regular, routine, tactical U.S. military communications. They've been gone for a long while. However, morse proponents are loathe to admit it, want to waltz around any statements of factual information so as to preserve their own myths and dreams that "their" ability will somehow be a "salvation of society when the Big Emergency comes along." Ergo, the amateur radio morse test for a license MUST be continued...to reinforce those dreams by forcing newcomers to do as they had to do once. Pfui.

>BTW -- SF would *never* be in *monitor* mode as they
>are totally dependent on MI for intel, right?

Accusatory, manufacturing an "argument" and baseless charge that never existed. Poor tactics.

Special Forces, Special Operations, Rangers, SEALS never go into the field without intelligence information. They aren't cowboys in the movie sense of the word. The SOURCE of intel can be from many places, different units. Most often that source IS from M.I.

>Feel free to use the argument that I was never in military service or had
>direct contact with SF. That seems to be a favorite with you. Oops, can't
>use either one of those -- too bad.

Again, a baseless "charge" about an "argument" that never existed.

I don't care if Macy co-wrote "Ballad of the Green Berets" or did a High Altitude Low Opening (HALO) drop into denied territory.

Those of us who had taken a military service OATH and served our country as part of the military are, in my book, quite qualified to argue ABOUT the U.S. military. Those who haven't aren't qualified. That qualification is on a helluva lot higher level than any test for a radio amateur license or DX honor roll standings or other hobby activities.

If Macy is a veteran, fine with me. I am. Status AS a veteran is NO qualification for an opinion being "more correct" than opinions from OTHER veterans. Keep that in mind.

You have aged, but not with much grace. Tsk, tsk, tsk.

Yeah, three months older since last posting. So is Macy. The PCTAs are still as graceless and uncivil as before.

I fervently hope you're not ignoran t enough to believe that is
is possible to be fully prepared for any possible circumstance. The best
possible way to be prepared is
to hae the maximum number of options. That includes
CW skill in this case. Since virtually every HF ham rig
made includes the mode with no further additional overhead
other than operator knowledge, it is sheer avoidance and
irresponsibility for hams to fail to do so. I know that you
know this, but prefer to continue on your jihad against the mode.

>When you tell the whole story, it looks a bit different.

Not really, Jim. The point that when I entered ham radio, that first rung was a very small one and that now, it is a much much larger step does not change.

IMHO, this does explain why we have far fewer 13 year olds entering ham radio than in the Novice heyday. More hams are entering ham radio now than then, but they are doing it at an older age.

>Nope. I've not disagreed with that. I just won't lap up your argument
>as anything of proof that morse is VITAL for anything BECAUSE
>one or two Special Forces MOSs require it.

And IF just ONE SF operator intercepts a message that leads to Osama's capture, how "unimportant" will Morse skill have been?

Everything about Osama's tactics have indicated "low tech" applications. Why would his communcations be any different?

>Monitoring, doing ELINT intercepts is a function of M.I., not S.F. >You should KNOW that if you work for the Department of the Army.

And how many MI folks are within simplex range of these emplacements? How many SF folks are?

>>He would also probably argue that
>>they would *never* use horses as a means of transportation either --- Oops,
>>they *did* do that, didn't they?
>
>Sorry you had to manufacture an argument that never existed.

What "manufactured"...?!?! Time, Newsweek, CNN, and every major news media has reported US forces on horseback in Afghanistan.

>I had high hopes that you might become civil and rational in here
>but you are still covertly libeling those who have climbed on you
>in the past.

And I had high hopes that you had done the same. Appears I was wrong. However YOUR "libeling" is more overt than covert.

>Not that it matters, but as far as I knew, the last permanent horse
>unit in the U.S. Army was in D.C. and used for ceremonial
>purposes...such as funeral processions.

Not that facts matter, but no one said anything about "permanent" horse units in ANY branch of the Armed Forces. I do know that facts in your rants are few and far between, but I am sure you have gotten your wind after this last sabatical.

>You must info-shop
>on the web because you've sure as hell not gone out to observe

>a modern-day Signal Battalion or Regiment in the field...or maybe
>you did and got pissed that they weren't using CW?

Lennie, Lennie, Lennie.....

Your own "info-shopping" has more often than not left you clueless and only half-informed. I am surprised that you would make such a foolish suggestion to another.

Cautiously yours,

Steve

Here's what you said ... (my emphasis added)

"None of the public information even hints at any "use" of ook cw codings as either being commsec, valuable, versatile, or as any part of US military communications doctrine. OOK CW CODINGS ARE NOT USED IN US MILITARY COMMUNICATIONS. There is absolutely no need to maintain any "pool of trained CW [OOK CW] operators" for any national security reason."

I replied that the SF still used Morse and you jumped on me with both hooves saying that they DID NOT train in, USE, or NEED OOK CW. After a very lengthy debate, you finally admitted that they were required to learn it and that it might be used on a very limited basis.

>
> Somewhere in that convoluted timeline Macy jumps in with
> making a Big Deal of "special forces 'Using' morse" as if
> that is the exception disproving the regular routine or

>

Never said, implied, hinted or otherwise wrote that it was in *routine* use. I said it was used by SF, that's all I have ever said. You *still* seem to have a real problem with this.

> I DID agree that (through checking elsewhere through public-
> access information Army sources) ONE special forces MOS

>>their troops to know Morse.
>
>Wrong again. The original subject thread concerned MORSE IN
>MILITARY COMMUNICATIONS. Communications of the two-way
>kind.

Nope. Lying again. You steadfastly denied ANY application of Morse Code skills in the Armed Forces.

>There was a long off-shoot of that thread concerning the
>SINCGARS...(SNIP)

Yes, yes, yes, Lennie...We are WELL aware of your numerous quotes and recitals on the SINCGARS system. Anytime you start getting backed into a corner that YOU painted, you trot it out and try to impress us with your ability to quote from the spec sheet and editorialize on how this system is the end-all of MILCOM.

Phooie. It impresses no one.

>Somewhere in that convoluted timeline Macy jumps in with
>making a Big Deal of "special forces 'Using' morse" as if
>that is the exception disproving the regular routine or
>tactical military communications modes not using morse.

YOU stated it was NOT in use and NOT taught at any level for ANY reason. Arnie has repeatedly proven you wrong, but you continue to flail away, hoping that SOMEONE will believe you.

Sorry.

>In the larger context of the thread, I STILL DO NOT AGREE
>WITH MACY on the U.S. military USING MORSE MODES
>FOR TACTICAL COMMUNICATIONS. They don't.

Prove it. Prove that there is NO use of Morse Code ANYWHERE by ANY branch of the Armed Forces, Lennie.

>Now, let me level a charge against Macy: As a civilian employee of
>the Department of the Army, Macy has easier access to information
>on communications methods, equipment, and personnel than most
>other newsgroup participants...whether it is classified or released to

>the public. Macy has NOT MENTIONED ANYTHING about accessing
>such information. NOTHING.

He has, but you have "dismissed" it as "PCTA misinformation" on frequent occassions.

And if it's classified, WHY would Arnie jeopardize his career over it in THIS forum? You flatter yourself again, Lennie.

>All of the above will indicate (without reasonable doubt) that morse
>methods are GONE from regular, routine, tactical U.S. military
>communications.

Does absence of data on a website "prove" that something doesn't exist? Or does it (more realistically) mean that someone doesn't want to discuss it for "whatever" reason?

>Accusatory, manufacturing an "argument" and baseless charge
>that never existed. Poor tactics.

Those in glass houses.............

>>Feel free to use the argument that I was never in military service or had
>>direct contact with SF. That seems to be a favorite with you. Oops, can't

Jim, as I've said before, I don't why or how one should "fear" being proved
wrong. What's going to happen? C'mon. Do *you* really think about it that
much?

Well, think about it. I don't subscribe to the "PCTA" and "NCTA" labels;
however, for the sake of demonstration...

When the two sides begin debate it doesn't matter which side it is, *both*
get derogatory pretty damned quick. I mean, I often think that the greatest
motivation isn't ham radio itself--or the pride of it, history of it, or
whatever of it. I wonder if most people in this newsgroup don't use it as
an excuse to just act like assholes, myself included. Think I'd get like I
do with someone on the air, or over the phone, or at work, or even at play?
I'm pretty cocky here in this newsgroup, but I am not that way at all in
person. That's because *most* of us in person would also act a whole lot
differently toward each other.

How many languages do you speak, Dick? How much HAZMAT gear do you have, Dick? Have you got a mobile phone? Have you got some FRS radios? Have you got a CB radio ready to be on the air? I could go on and on. To use your analogy (a piss-poor one, I'd add), then anyone who doesn't "arm" themselves with extra language capability, extra contact cabability, and so on, is *not* to have the maximum number of options.

You're all hot air. However, if you'd come up with some truly viable argument for your passion for CW, then we'd all be probably more than willing to listen. I know I would be.

But one can't "read the manual" until AFTER purchase. Your reasoning is
circular.

However, here's another example: A cordless phone package. It states "15 user
selectable channels" on the box. In that case, no one would assume the entire
frequency range.

The problem is that often, this wireless LAN stuff DOESN'T say that one may
pick a subset of the range.

>> As a person involved in manufacture, shouldn't you be telling your

Motorola does offer SERVICE MANUALS for their equipment which do contain
schematics. This example is not comparable.

FHSS and DSSS have no meaning to those not familiar with spread spectrum. You should avoid using "industry insider" terms without defining them. Also, I couldn't care if it's a direct sequence or another pattern - because the actual pattern doesn't matter when one is considering on what frequencies it COULD go to.

I assume wrong? By the fact that you just confirmed that it could spread over the entire band, you just VALIDATED my assumption, not contradicted it.

>You seem to have some confusion about the characteristics of FHSS vs. DSSS
>systems ... the ARRL publishes at least one reasonably good tutorial book on

>Spectrum Systems" by Dixon, published by Wiley ... I recommend it highly for
>even the semi-serious student of SS.

Who said that I was confused? Generally, these items simply say "SS" and don't tell us how or which particular algorithm it uses internally. Now, you are correct that I can be confused over which method a particular device uses, especially if the BOX/packaging DOESN'T SAY (or say something that leads to method identification). That's my point. It doesn't say.

Again, one only has access to the manual AFTER purchase. How can one make an informed decision beforehand? Circular reasoning.

I didn't say that. He said "at once."

In spreading, SS transmits on a narrow segment of the band, then moves to
another segment. It does NOT transmit on the entire band simultaneously.

>> However, unless it is stated that only a subset is used, I do assume that a
>SS
>> signal may hop onto any frequency in its defined range.
>
>But you just said that you didn't think that a device that did so would be
>spread spectrum. ???

Wrong. It's not placing RF energy across the entire band simultaneously. It's
only placing it at a particular point, then moving to another point, etc....

If one averages over a long enough period, one could get a spectrum analysis of
an SS signal that looks like a wide band signal, but the two signal types are
arrived at in different ways.

Ah - but I note that you keep citing it as 802.11, which is apparently
different from 802.11b. There's part of the issue right there! Those
"standards" are different.

But as I said, one could expect that the device (in the absence of additional information) could enter any frequency in the band, and since the amateur band is NOT the entire ISM band, from the amateur point of view, an out-of-band transmission possibility clearly exists. Now, if the amateur in question is unaware that there is sufficient user control to limit the range to a subset of the stated product range, he will dismiss the item as unsuitable because of the possibility of the out-of-band transmission (assuming he intended to use the device in a way that exceeds part 15). My issue is knowledge: The product doesn't say so. Many people have other things to do in life than to bother looking up some document for some minor part of text that in fact can tell them that it can be limited.

Remember what some of the early cordless phones said: Frequency 49MHz. 10 selectable channels. (Now, 25 channels) I think you get the point. Those devices made it clear that there was a subset they could operate on. The wireless lan stuff doesn't.

2923. Re: Hey Carl . . .

Newsgroup: rec.radio.amateur.policy
Date: 2002-01-29 00:35:19 UTC
From: Arnie Macy <kt4st@csam.net>
Message-ID: <1%l58.114313$Ee7.7921173@e3500-atl1.usenetserver.com>
Source record: 32434

Dick wrote in part ...

"... That includes CW skill in this case. Since virtually every HF ham rig made includes the mode with no further additional overhead other than operator knowledge, it is sheer avoidance and irresponsibility for hams to fail to do so. I know that you know this, but prefer to continue on your jihad against the mode."

Kim responded in part ...

"How many languages do you speak, Dick? How much HAZMAT gear do you have, Dick? Have you got a mobile phone? Have you got some FRS radios? Have you got a CB radio ready to be on the air? I could go on and on. To use your analogy (a piss-poor one, I'd add), then anyone who doesn't "arm" themselves with extra language capability, extra contact cabability, and so on, is *not* to have the maximum number of options."

I think Dick makes a valid point here, Kim. The radio already has the ability "built -in". Why not take full advantage of it. Exchange a microphone for a key and the same amount of external equipment can give you twice the capability. It's not like going out and purchasing or building additional equipment, merely a case of taking advantage of what's already there.

One analogy I can think of would be using a vacuum cleaner. We could lift up the vacuum to clean the drapes -- or -- take advantage of the built-in attachments to do the job. Simply a matter of learning how to use them.

You can certainly state it but that doesn't prove validity. Can you prove
that you didn't use illegal drugs in high school or college? Can you prove
that you don't have access to a secret antidote that renders illegal drugs
undetectable? It is logically impossible to prove a non-exclusive negative,
Arnie. That has been known to be a fact for centuries. Your abive feeble
attempt to turn it into an exclusive negative failed.

Agree with you on this one, Cecil. That's why we need to work even harder
to get young people interested in Ham radio. I sometimes talk about CW and
"sell" it as that cool code they can use to talk to each other. I also tell
them that they can shoot moonbounce, talk to the space-station, use computer
controlled rigs, program, and build to their heart's content (but don't
mention that hot solder can burn the living crap out of ya)

The security in 802.11b has been improved (at least in my
company's products) with "enhanced WEP" ... though I still
use a VPN for real security on my company communications
via my residential gateway ...

Also, IEEE 802.11 has a task group working as we speak on
even better security ... should be MUCH better from what I've
seen.

Authentication might be arguably permissable ... though someone
would probably try to make the argument that a series of digital
signatures could be used, over time, to convey "secret information."

I don't want to get into a lengthy discussion of it, but I'd certainly
like to see strong encryption allowed for certain things, like
control links, for example.

> another segment. It does NOT transmit on the entire band
simultaneously.

You are apparently refering to FHSS ... DSSS doesn't hop at all ...
it just sits on one (carrier) frequency and spreads over some
bandwidth that's wider than necessary to convey the underlying
information (with the width being determined by the rate of the PN
spreading sequence ...)

Again, with all due respect, I'd suggest a good tutorial on SS for
you ... you're spreading a lot of misinformation that will
mal-educate
those who don't know any better.

> >> However, unless it is stated that only a subset is used, I do
assume that a
> >SS
> >> signal may hop onto any frequency in its defined range.

Again, ONLY ONE TYPE OF SS "hops" ... that's FHSS ... DSSS
does NOT hop (though you can build a hybrid system which is a
DSSS which does hop, the DSSS in use in Part 15 devices does
not)

> Ah - but I note that you keep citing it as 802.11, which is
apparently
> different from 802.11b. There's part of the issue right there!
Those
> "standards" are different.

802.11 is the BASE standard ... which defines several PHYs (IR,
FHSS, and DSSS) and a single MAC ... the IR and FHSS have
died off.

802.11b is an EXTENSION which defines the parts necessary
to get to 11 Mbps in the 2.4 GHz band.

802.11a is another EXTENSION which defines the parts necessary
to get to 54 Mbps in the 5 GHz band.

Again ... RTFM, please ...

I said that it COULD ... not that real world systems DO as a practical
matter ... you're looking for "validation" of your flawed ASSumptions
now ...

Your entire dissertation in this thread has continually talked about
"hopping" ... when the products you're trying to talk about don't
do that ... I'd say that in itself demonstrates pretty convincingly
that
you're confused about SS and don't understand (at least correctly)
even the basics of the differenty types of SS and how they work.

Why don't you learn a bit about SS ... then come back and try to
talk intelligently about it?

BS ... I gave you a URL where you could download the entire 802.11b
standard ... again, I suggest you engage in some learning before you
engage in spouting off about things you obviously know little about.

BTW ... I'm losing patience with your diatribe ... I probably won't
respond to it further.

I stand corrected ... your explaination is, of course, EXACTLY
correct. (and is the point that I've been trying to make for
some time, but lots of folks "just don't seem to get it."

> Even in a system that dynamically allocated frequency for a

>
> The difference is that every single ham who wanted access to a
similar channel
> in that band could have it, limited only by the fact that only N
number of
> people could use that band *at the same time.*

And the physical channels could be assigned without regard to
whether the traffic was voice or data ... the "virtual channels"
would be all the users would "notice" or care about in an operational
sense.

Moreover, when the statistical nature of "traffic offered" is
considered
via the Erlang equation, it can be easily shown that a VASTLY larger
number of users can be served with a much lower "blocking probability"
when a pool of channels is assigned dynamically than when the same
number of channels are assigned in a fixed, inflexible manner.
(classical trunking theory ... another communications principle that's
over 50 years old and still rejected by the majority of hams ...)

Not a feeble attempt at all. It's quite logical. Given a reasonable set of
circumstances (exclusive of your extreme possiblities) the average person
would easily conclude that I don't use illegal drugs.

The latest ARRL Handbooks have a couple of pages of useful information.
The graph of power Vs frequency on DSSS shows a ((sin x)/x)^2 curve
indicating that a DSSS signal could indeed occupy the entire band.

I have a vague recollection -- might be mistaken -- that someone (Phil Karn?) queried the FCC on this point once and got back an okay for use of digital signing. In any case, I don't see a problem since there is no intent to hide anything as long as the text itself is in the clear.

> though someone would
> probably try to make the argument that a series of digital signatures

Maybe someone would, but it would be an easily overturned argument.

> links, for example.

Encryption provides little benefit and significant risk. Strong authentication, which I believe is presently allowable, is sufficient to protect against unauthorized use of systems. Encryption is too easily abused.

Jon

I'm not talking about guilt/innocence in a court of law. I'm talking about formal logical proof. It doesn't matter what the average person concludes, you cannot logically prove that you have never used illegal drugs. For the same reason, it is impossible to prove that no one in the military uses CW. Asking someone to prove a non-exclusive negative is showing one's ignorance of the formal logic branch of mathematics.

Now, now, my petulant Inspector Clue-so, you are getting all fired up... :-)

What Macy has just done is some careful selective editing to
"prove" his case...which is no "proof" that Macy is right.

Macy, as an ardent supporter of morse modes, forgot that the
EVIDENCE was merely that a certain Special Forces MOS
required morse code skill. Period. Special Forces doctrine is
not yet released in its entirety for public viewing.

What was at issue was morse modes as COMMUNICATIONS IN
THE U.S. MILITARY whether routine, regular, or tactical in its
use. Morse modes are NOT in COMMUNICATIONS, as in two-
way communications for routine, regular, or tactical purposes.
Voice, data, imagery, is in single-channel and multichannel
carrier, in-clear or encrypted. NO morse modes.

That is public data, may be verified through many public-access
sources.

Special Forces doctrine published for public viewing, does NOT
state or imply that morse modes ARE used in SF
communications. All the information can state is that an MOS

for SF requires morse skill.

Passive, one-way interception of radio signals may involve morse
skill to "read" sufficiently well to ascertain if the signal is worth
recording. That is in the descriptors of the morse intercept
training courses given at Fort Huachuca.

Passive, one-way interception is NOT "communications" in the
normal sense.

>> Somewhere in that convoluted timeline Macy jumps in with
>> making a Big Deal of "special forces 'Using' morse" as if

>> tactical military communications modes not using morse.
>
>Never said, implied, hinted or otherwise wrote that it was in *routine* use.
>I said it was used by SF, that's all I have ever said. You *still* seem to
>have a real problem with this.

Macy DID IMPLY, allude to the Special Forces communications
MOS as stating that morse skill disproves any blanket statement
that morse modes are not used in the U.S. military for regular,
routine, or tactical communications.

Of course, the inspector STILL refuses to check any OTHER
Army or U.S. military information on what modes ARE BEING
USED. He cannot since that disproves his allegation that
"morse is used in the U.S. military" (because an SF comm
MOS requires the skill).

>> I DID agree that (through checking elsewhere through public-
>> access information Army sources) ONE special forces MOS
>> requires morse ability. Macy then tried to manuever the sub-

>> "would not admit to Macy being right (about SF)."
>
>You called me some pretty ugly names, then finally and, by God, it was just
>like pulling teeth, you admitted that I was correct in my original statement
>that SF used Morse.

What "ugly names," inspector? :-)

Is it UGLY that I don't agree with your insistence that the U.S.
military still uses morse? It must be, since you are fixated on
US-military-uses-morse-because-SF-Comm-MOS-requires-the-
skill...and haven't YET gone on to check what the U.S. military
REALLY USES TODAY.

Show us your PROOF that signal battalions and signal regiments
regularly, routinely, or even tactically USE MORSE MODES
TODAY or even ten years ago. There are plenty of periodicals
where you can read up on what is used, see pictures, and all
that. Try snagging a copy of SIGNAL magazine...it's an Army

publication.

>> I am simply pointing out publicly-available information sources that

>
>You wouldn't have *dared* call that number because it would have proven you
>WRONG, and you would never let that happen. Like I said, you haven't
>changed a bit, so WRT you, I won't either.

Macy posted a "blind" telephone number, perhaps thinking that all
had an AUTODIN or AUTOVON directory at hand to "verify" it. :-)
Sorry, no Caller ID works in reverse, sport. You merely BLUFFED,
got caught at it, are now pissed that I didn't bite. :-)

Macy has to go research in his own Army backyard, to see, first
hand, what the Army uses for modes, methods, manpower skills
in regular, routine, tactical communications. GO AND DO THAT.
Macy is in a unique position there, can do a bit of calling through
official channels of many kinds to verify that.

It won't happen, Macy will DENY it, the truth, whatever else in
order to prove "he was right in his messaging." Matters not to
anyone else, only Macy. The U.S. Army Signal Corps has its
own plans, as does USN, USAF, and USCG communications.
It NO LONGER involves morse modes.

Try, please TRY to accept the truth.

Probably a lot easier than Lennie can substantiate any of his chronic lying. If you'd care to pay for it, you are welcome to do a forensic tissue sampling on myself to assertain the historical presence of any "illegal" drugs.

And it IS a "valid" challenge. Lennie has repeatedly asserted that Morse Code was NOT "used", pasively or actively, and yet it is still taught BY the Armed Forces to some segment of it's members.

HE made the assertion, he is now challenged to make good his claim.

He will, of course, sling mud then run for cover.

>Now, now, my petulant Inspector Clue-so, you are getting all fired up

>What Macy has just done is some careful selective editing to
>"prove" his case...which is no "proof" that Macy is right

Unable to escape the fact that he has again been tripped up by his OWN posting misdeeds, Lennie immediately resorts to his patented "insult and lie" method of responding.

No "selective editing" on Arnie's part occured. The assertion by Leonard H. Anderson is a lie.

(Use of terms like "error", "mistruth", etc are sugar coated ways to say he lied, ergo I shall not use them. They are "PC" coverups)

>Macy, as an ardent supporter of morse modes, forgot that the
>EVIDENCE was merely that a certain Special Forces MOS
>required morse code skill. Period. Special Forces doctrine is
>not yet released in its entirety for public viewing.

And to this date Lennie the Clueless cannot present one shred of enplanation as to why the Armed Forces of the United States would TEACH Morse Code techniques to it's personnel and yet then have no expectation that they'd be USED for that purpose.

>What was at issue was morse modes as COMMUNICATIONS IN
>THE U.S. MILITARY whether routine, regular, or tactical in its
>use. Morse modes are NOT in COMMUNICATIONS, as in two-
>way communications for routine, regular, or tactical purposes.
>Voice, data, imagery, is in single-channel and multichannel
>carrier, in-clear or encrypted. NO morse modes.

Prove it.

>That is public data, may be verified through many public-access
>sources.

And I am willing to bet there are projects in the works at Lockheed's Skunk Works of which there is NO public-access sources. Does that lack of documentation mean that they aren't there?

>Passive, one-way interception of radio signals may involve morse
>skill to "read" sufficiently well to ascertain if the signal is worth

>recording. That is in the descriptors of the morse intercept
>training courses given at Fort Huachuca.

How do these operators determine the validity of those signals without
being practiced in thier use?

>Passive, one-way interception is NOT "communications" in the
>normal sense.

There is absolutely nothing normal about any of your rationale's, Lennie.

>Macy DID IMPLY, allude to the Special Forces communications
>MOS as stating that morse skill disproves any blanket statement
>that morse modes are not used in the U.S. military for regular,
>routine, or tactical communications.

"IMPLY", Your Abusiveness? So now we are to try and "assume" what he
meant?

>Of course, the inspector STILL refuses to check any OTHER
>Army or U.S. military information on what modes ARE BEING
>USED. He cannot since that disproves his allegation that
>"morse is used in the U.S. military" (because an SF comm
>MOS requires the skill).

And you have yet to prove they do not use them. You have SAID they do
not, but cannot prove to us. You simply IMPLY that they do not by lack of
reference to them in websites.

>Is it UGLY that I don't agree with your insistence that the U.S.
>military still uses morse?

What's ugly is that a person (notice the lack of reference to the term
"man") such as yourself INTENTIONALLY sets out to be abusive, decietful and
decieving...What's PITIFUL is that it is fed back to you by NUMEROUS other
posters, yet you continue to lie.

>Show us your PROOF that signal battalions and signal regiments
>regularly, routinely, or even tactically USE MORSE MODES
>TODAY or even ten years ago. There are plenty of periodicals
>where you can read up on what is used, see pictures, and all
>that. Try snagging a copy of SIGNAL magazine...it's an Army
>publication.

Prove that they don't.

>Macy posted a "blind" telephone number, perhaps thinking that all
>had an AUTODIN or AUTOVON directory at hand to "verify" it. :-)
>Sorry, no Caller ID works in reverse, sport. You merely BLUFFED,
>got caught at it, are now pissed that I didn't bite.

Got caught at what? He posted names, numbers and detailed
points-of-contact. Something YOU have NEVER done. YOU are the one who's upset
at having been outmaneuvered by someone who uses FACT rather than fiction.

>Macy is in a unique position there, can do a bit of calling through
>official channels of many kinds to verify that.

Yes he is. And it appears, on more occasion than one that he DID do his homework.

YOU, on the otherhad, try and "dismiss" his information.

>It won't happen, Macy will DENY it, the truth, whatever else in
>order to prove "he was right in his messaging."

From you, a compliment...erroneous, but a backhanded compliment none-the-less.

>Matters not to
>anyone else, only Macy. The U.S. Army Signal Corps has its
>own plans, as does USN, USAF, and USCG communications.
>It NO LONGER involves morse modes.
>
>Try, please TRY to accept the truth.

Any suggestion from Leonard H Anderson about someone ELSE accepting "the truth" is tragically comical.

Lennie, you couldn't tell the truth if it were your wife's life.

Laughingly Yours,

Steve

Okay. I do that from time to time.

Personally, I think that more people join ARRL to support its spectrum efforts than to receive QST. This is especially true now that ARRL is not being so secretive about what it does in that area. The information on the ARRL web page, and the new regular feature on the page about "What Has ARRL Done Lately" are, IMHO, positive and overdue moves.

>(classical trunking theory ... another communications principle that's
>over 50 years old and still rejected by the majority of hams ...)

Now, in fairness, Carl, most of today's ham radio operation is done using commercially available amateur equipment. If such features were available in modern ham gear, I think that hams would use them. In pointing out what is possible, I do not mean to blame hams for not using what is not available to them.

As software-defined radio becomes more entrenched in modern radio, I think that we will see SDRs in use in the ham bands, too. Writing the code to make a universal radio a ham-band radio will be the easiest way for a manufacturer to produce ham gear.

I am hoping that the programmability of the SDRs will be available, giving hams the ability to experiment with coding to improve the radios. Come to think of it, the IEEE 802.11b devices are also quite programmable, although I believe that at this time, the programmability is a closely guarded trade secret. :-)

>I was taking it as a given that, absent S25.5, the entry level
>class would have at least limited HF privileges (based on
>technical knowledge, rather than Morse proficiency).

Even if the entry level were given HF priveleges similar to the current Tech+, it makes little sense to have an "entry level" license that gives full priveleges on VHF-daylight, including the right to use 1500 watts, and severely limiting HF access and power. IMHO, it would make more sense to have an entry class that is reasonably easy to obtain, but with power and frequency limits evenly spread across the bands. Just as an example, perhaps voice/data/cw priveleges on 75/80 M, 40 M, 15 M, 10 M, and operation on 2 meters, limited to 100 watts would be a reasonable starting point. The 75/80 M and 2 M operation would help the new ham be better connected to his or her locals, and the 40, 15 and 10 M would give the ham some interesting DX priveleges.

Just my personal view at this time. I am sure that my views will evolve as we get closer to the point where the FCC has to consider what to do.

WHY must there be a "serious" number of new hams that learn
morse code anyway? No one has shown any reason for there
to be any large number of hams engaged in morse knowledge/use
anymore than anyone showing there are large (serious) numbers
of hams engaged in public service, homebrewing, etc.

>"their channel" (the repeater pair) is always available
>for their (more or less) exclusive use. So they tend to
>stay parked on that channel, "waiting for Joe to show
>up so they can talk to him."

Maybe where you are, Carl, but not where I've lived and operated.

Here in southeast PA most repeaters are "open". During busy times there is
a roundtable going on, to which all who follow the rules are invited. During
quiet times stations will make specific calls or simply announce their presence

to drum up QSOs. Most repeaters also have scheduled nets for a variety of
purposes, ranging from SKYWARN to swapnets to special event talk-ins.

If I want to "talk to Joe", I'll simply call him on the repeater(s) he's known
to monitor. If I find him on a busy machine, we'll go simplex or jump to a
quiet repeater.

All it takes is a simple "call please" and those using the repeater stand by
for a quick call.

>If another group were to put another repeater on the
>same pair, then the two groups would have to wait for
>each other to finish using the shared channel.

They also have to put up with their repeater being keyed up unintentionally
unless they use PL tones.

>So, it's

>Oh, gosh, sorry

You are forgivenm, my child. ;-)

>My point is that three people discussing the ways of
>tuning on RRAP are not a good "poll" Jim.

Wasn't meant to be. It's a discussion that involves both technical and
operating matters. I say tuning up on-air is OK IFF it's done considerately.

>I haven't read the text in all
>the posts on tuning, as I don't care how you or Brian, or Joe Schmoe tunes.

So your attitude is that you don't want to learn new things, or even discuss
them.
Interesting.

>I'll tune with a carrier.

What rigs do you have that require being tuned up in the first place?
>
>Point is, there's nothing illegal about it.

Actually, unnecessary tuning IS illegal. So is causing avoidable interference
to
other amateurs.

>>users, but not at the data rates that today's LANs need to carry.
>
>I assume wrong? By the fact that you just confirmed that it could spread
>over
>the entire band, you just VALIDATED my assumption, not contradicted it.

Your assumption is wrong if it is an assumption about the 2.4 GHz, 11 Mb/s
wireless devices. Although a DSSS device could be designed to spread over any
arbitrary frequency range, those particular devices as described in the IEEE
802.11b standard do not.

>Who said that I was confused? Generally, these items simply say "SS" and
>don't
>tell us how or which particular algorithm it uses internally.

You are confused. The devices state, even on the box, that they use the IEEE
802.11b protocols.

> Now, you are
>correct that I can be confused over which method a particular device uses,
>especially if the BOX/packaging DOESN'T SAY (or say something that leads to
>method identification). That's my point. It doesn't say.

The box I have says that it uses the IEEE 802.11b protocol. That tells me
exactly how the device will work.

>Again, one only has access to the manual AFTER purchase. How can one make an
>informed decision beforehand? Circular reasoning.

Carl has posted a number of URLs that have all sorts of information about the
IEEE 802.11 standards. He is suggesting that you read them so you will not
continue to post misinformation about what they are and what they do.

>FHSS and DSSS have no meaning to those not familiar with spread spectrum.
>You
>should avoid using "industry insider" terms without defining them.

Carl and I have both used the full terms -- frequency hopping spread spectrum
and direct sequence spread system -- at some points in this thread.

>Also, I
>couldn't care if it's a direct sequence or another pattern - because the
>actual
>pattern doesn't matter when one is considering on what frequencies it COULD
>go
>to.

I don't even understand this. What do you mean by "direct sequence or another
pattern?" You are correct, for DSSS, the pattern used for the spreading does
not have much effect on the occupied bandwidth. That is a function of the
speed of the spreading code and the nature of the modulation. Those are very
well defined in the IEEE 802.11 standards.

There is nothing there that says I *have* to submit the CSCE's.... If I feel the need to, I will. But not because others want me to. Merely because I want to. HF right now has no appeal to me, but who knows, maybe later. I am interested in learning more about some of the digital modes, and unfortunately, that is the only area where most of the activity is. I am aware that there is some amount of VHF/UHF digital modes being used, but not alot around here. Digipeaters are deader than the regular repeaters. Who knows, I have a much more important priority in my life, and that is finishing the rest of my training and certification in field of employment. After all, this is only a hobby service, not a career. Even in the Amateurs Code it states that a well balance between Amateur Radio and other parts of a persons life is necessary. Unfortunately some people don't get that fact.

Maybe later this summer I will dig back in to the hobby alot more, but in the meantime I have much greater priorities at hand, and if I do not focus on that, someone could die, including my partners.

To clarify, I took the test in 1989. I passed the novice and tech written. I passed the code test not by answering the questions correctly, but I did however have one solid minute of code copied correctly. I also learned that this particular VE team was not accepting that method of passing, and the only acceptable *passing* score was a 100%. (not the 7 or 8 or 9 out of ten) They would not accept anything else. I have come to figure out they were wrong.

As far as recent tests, I had already taken the technician written, thus resulting in current callsign. Later on I had passed the written for the general class and have a CSCE for that. Recently I have passed the code test and requested the CSCE for that. Hopefully that clears things up a little.

Who was handing out the books? I had to buy mine!

What Techs
> get for their effort is ALL VHF/UHF at 1.5 kW power, but extremely limited
> HF/MF.

Last I checked, techs now only have VHF/UHF privileges. Although they may have privileges of up to 1500 watts, I do not see why that level is necessary. At a maximum of 200-300 watts should allow communications with another station just about anywhere in any state, on any of the bands from 50Mhz on up as far as mobiles are concerned. And residential setups with a decent antenna system should definitely have better luck there.

> Only tiny slices of four bands, and only two modes! I think the "entry
level"
> license
> should allow more spectrum and modes but less power. Remember, RF safety
was
> not a concern back when the structure was created.

I would support a entry level of licensure that would give a taste of 1 HF band, say like 10m and say 2 meters. Then have the General, Advanced and Extra Class licenses testing go back to what it was 15-30 years ago. What to do with all the various licensees during the changes of the past 20 years or so, I don't have the solution to that, but making them upgrade to General as a minimum seems like the only solution. Who knows.....

>Last I checked, techs now only have VHF/UHF privileges.

This is incorrect. Technician Class operators can operate on all bands 6 M and up. >have privileges of up to 1500 watts, I do not see why that level is >necessary. At a maximum of 200-300 watts should allow communications with >another station just about anywhere in any state, on any of the bands from >50Mhz on up as far as mobiles are concerned.

Unless you are working one of the super stations, 1500 watts is needed for conventional moonbounce. Some hams have recently been experimenting with long-term integration to accomplish moonbounce at QRP levels, though.

>I would support a entry level of licensure that would give a taste of 1 HF >band, say like 10m and say 2 meters.

If you limit the entry level too much, no one will want to play.

Lennie:

Yes, that is correct. I was also making my living driving a limousine before, during, and after my recent college studies and graduation. As it happens, I have a degree in Human Resources Management, but my position as a Paratransit Operator pays better than most jobs in this field -- which I have been unable to get, mainly due to my age, sex, and lack of minority status. My job involves providing safe, accommodating transportation to people who are elderly, ill, or who possess various physical or mental challenges. It is far more than merely being a "bus driver." It is a very satisfactory job, has a fairly low stress level, and permits me to "be my own boss" to a very great extent. I have already declined a position as a supervisor/dispatcher, because after trying it for a week, I decided I liked driving better -- and I missed the people I was working with.

I have already spent the best years of my adult life as a supervisor and manager -- I have nothing to prove to myself or anyone else with regard to my ability to accept responsibility. I could accept a position as a Street Supervisor if I remain with my company long enough; I have other irons in the fire as of the last few weeks, and another career change could occur. BTW -- among my "bus driver" colleagues are several others with college degrees, a former Dentist, and a Baptist Minister with a Master's in Divinity.

I don't recall ever making fun of your occupation, Len. To what do I owe this treatment?

That wouldn't prove that you didn't use illegal drugs when you were a
teenager. It is impossible for you to prove that you have never used
illegal drugs. It is impossible for anyone to prove that the military
doesn't use Morse code.

> And it IS a "valid" challenge. Lennie has repeatedly asserted that Morse
> Code was NOT "used", pasively or actively, and yet it is still taught BY the
> Armed Forces to some segment of it's members.

I'm not talking about something in particular, Steve. It is a generalization
applicable to *all* logical proofs. The onus of proof is upon the person who
asserts the *positive* premise. In this case, that would be you and Arnie.

To prove the military uses Morse code takes one example and is relatively
easy to prove. To prove the military doesn't use Morse code takes an almost
infinite number of samples and is impossible to prove.

> HE made the assertion, he is now challenged to make good his claim.

It is impossible for anyone to prove that Morse code is not used by the
military, i.e. a non-exclusive negative premise cannot be proven. That's
an accepted rule of classical logic. But IMO, there's a high probability
that our special forces can monitor the enemy's CW transmissions. I
wouldn't be surprised if some of those guys were hams.

There is no requirement for them to become hams. There is no requirement
for them to use SSB. There is no requirement for them to use FM.

Your negative opinion of Morse code is showing again, Dick. I believe that
CW has enough merit that a lot of new hams will choose to learn Morse code.
It's obvious you believe that CW doesn't have much merit, i.e. is a waste
of time, so nobody will choose to learn Morse code. With friends like you,
CW doesn't need any enemies.

Ed:

This has to be one of the most childishly naive comments I've ever seen on this newsgroup. If QST wern't an automatic by-product of ARRL membership, said membership would dwindle to next to nothing -- and you bloody damn well know it! To the average Joe Sixpack Bagadonuts no-coder I'mAWannaBeHamOrJustLookLikeOne, the ARRL just publishes a slick magazine with lots of pretty pictures to look at every month, and handy articles like The Doctor Is In that answer the same embarrassingly simplistic questions every month.

> This is especially true now that ARRL is not being so
>secretive about what it does in that area. The information on the ARRL web
>page, and the new regular feature on the page about "What Has ARRL Done
>Lately"
>are, IMHO, positive and overdue moves.

The thing that is overdue from the ARRL is a nationwide, major mass-media campaign to publicize the ARS, in order to help us gain public support through vastly increased numbers of licensees. Instead, the ARRL depends on local No-coders wearing a pretty ARRL Public Information Officer badge to club meetings, but doing absolutely nothing to get meaningful press/media exposure for our hobby/service -- while hams are being voted out of existence with CC&R's all over the country. Give me a break!

The only thing that could possibly save ham radio is to get some PSA's on the TV during Prime Time. I don't care if the ARRL HQ building has to be sold, QST reduced to a newsprint rag, and the ARRL HQ staff converted into a handful of unpaid volunteers shivering in a tent and taking turns sending W1AW code practice with a J-38. All the fat, comfortable, and financially secure ARRL staffers are convinced they are working to "save" ham radio. HA!!! How could that ever be possible, when some teen-ager with multiple body piercings and a cell phone can out-communicate the average entry-level ham by several orders of magnitude? Get us on TV -- Get us on MTV --

or we're going to be extinct in a few years.

Cecil, I'd be satisfied if The Licenseless One could produce ONE person in position of authority or responsibility in DoD that would be willing to say "The Armed Forces of the United States no longer uses manual telegraphy for ANY on-going communications, tactical or strategic, small unit or large."

He cannot.

However Arnie HAS produced points-of-contact within DoD who CAN verify that Morse Code IS not only taught, but has practical application in the Armed Forces of the United States.

Lennie says it's a ruse, however he has himself admitted a lack of resolve to call the numbers himself.

I am reminded of the closing moments of "Star Trek: The Motion Picture" when V'ger short-circuits itself rather than hear the truth.

Power limits can be linked to (and justified on) the demonstrated
level of technical proficiency ... frequency limits are more arbitrary
and therefore more debatable. (What's the *real* difference between
7220 and 7230, for example, in terms of the technical competence
required?)

Heavens, no ... I would envision IDing in the clear with only limited
command/control functional data allowed to be encrypted. I think
such limitations could satisfy the FCC's needs in all practical
respects.

Pardon, Sir, but your Troll light is on again. It's YOU who
constantly downplay the value of not only CW but ham radio
in its entirety, a la "Ham radio itself is trivial...". And then you accuse me of
being an enemy of CW when I assert the plain
truth - that it has almost universal communications value, but
only when hams learn it, which has been made clear by all the
codebashing whiners they will NOT do, even when it was a requirement for licensing,
much less when there is no licensing requirement.
What a fool you continue to be..

Hmm... I believe you're one who derided my statement a few years ago right here when I said that when/if aliens (earthlings, not extraterrestial) ever invade us they would do well to use CW for all their communications because by then no one will be able tell what it is, much less what they're saying. Changed your mind???

If it makes you happy, Len, I drive a bus as well and I have TWO degrees including a Masters. I did my cubical rat thing for 25 years and am about a year from collecting a nice retirement check and tapping a 6 figure IRA/401k. I drive because I want to: as Larry points out is it a useful, low-stress occupation that pays decently. And I have nothing to prove to you or anyone else.

Years ago I ate at the Blackhawk Cafe in the Chicago Loop with a group that included a PhD garbage man. He got the biggest chuckle out of wondering what the yuppies at the next table would think about eating with a G-Man. He had nothing to prove either.

Yes, really, Ed. The "entry level" Novice license of the 1960s was
a whole different animal from the "entry level" Tech of today.

Maybe we are saying the same thing different ways.

> The point that when I entered ham radio, that first rung was
> a very small one and that now, it is a much much larger step does not change.

Which is why the thread about a post-S25.5 US license structure was
started by Mr. Plourde.

> IMHO, this does explain why we have far fewer 13 year olds entering ham radio
> than in the Novice heyday. More hams are entering ham radio now than then, but
> they are doing it at an older age.

It's only one reason, and a minor reason at that. Here are some more:
1) There are lots of 2-way electronic communication "hobbies"
besides ham radio today. Back in the "Novice heyday" a teenager had
very few other options
2) Antenna restrictions and RFI concerns make ham radio difficult or
impossible for many young people. Heck, I started out with the
proverbial one-tube oscillator transmitter feeding the end-fed wire
out to the apple tree. Many 13 year olds today can't put up any kind
of antenna, even if they have the yard and antenna.
3) Lack of publicity (relates to 1))
4) Perceived high cost of getting started. (note "perceived")
5) Demographics

But let's fix what can be fixed. See the "S25.5 proposal proposal" thread
for some ideas.

IMO, the US government military/intelligence folk will never not be able
to monitor and decode all known codes. Encrypted CW would be a logical
choice for terrorists having lots of bang for the bucks.

Jim,

How does speaking of the "average" constitute "characterize(ing)
the ARS by its trailing edge"??? That's a contradiction spun by you
in an attempt to defuse the assertion of my opinion.

As far as the leading edge goes, my concern is that it is vanishingly
small, and with people like Dick ("don't need to know squat about
Shannon or any other BASIC principles of communcation theory")
Carroll posing as "mainstream" it's only likely to shrink ... that's
why
I oppose Dick's viewpoints so vehemently.

Since you're obiously an educated person, I have difficulty
understanding why/how you can be so comfortable in supporting
such backward thinking.

Carl - wa6vse

Your decision is correct...can Kelly discuss, debate, or argue a subject successfully?

Hmmm...let's see, for "laffs," something about "26 patents" that turned out to be ONE...WW2 land vehicles having 28 VDC batteries. Just two for starters. :-)

Then there's the constant barrage of everyone MUST do things that a certain in-group of long-time OFs do or be labeled as deficient, un-real, or otherwise "bad" in a hobby activity. :-)

This is just a side-note on Software-Defined Radio (SDR), Ed, but
anyone can go to the Harris website and examine the description
of their "Falcon II" radio systems. Frequency range 1.6 to 512 MHz,
just about any mode anyone can want. SDR all the way, including
secure stuff only for military use. www.harris.com

Harris recently got a Big contract to make them for the U.K.

>I am hoping that the programmability of the SDRs will be available, giving
>hams the ability to experiment with coding to improve the radios.

Please define the above. "Programmability" of present-day SDR,
including the 14-year operational U.S. SINCGARS military radio,
is rather embedded in firmware, stuck in micron-dimension silicon.

"Programmability" requires some reasonable approach to a
standard (or even common-use) "language" for anything to be
shared in a hobby activity. The closest I can see to that is the
industry's GPIB (IEEE 488) for test equipment.

>Come to think of
>it, the IEEE 802.11b devices are also quite programmable, although I believe
>that at this time, the programmability is a closely guarded trade secret. :-)

Oh, oh! Ed, you mentioned the word "secret" here! A whole buncha
folks will pick up on that and immediately initiate CONSPIRACY
commentary or other snarly stuff about SECRECY! :-)

Most folks haven't yet discovered that strength of coding, such as
for SS applications, is NOT in the direct, immediate hardware or
firmware but rather in the coding system itself. The coding system
can be devised to be as versatile as possible for an application; i.e.,
to allow most available "narrowband" modes now available to radio
amateurs plus expansion to other modes at a later time. The
problem with trying to devise such a programming system lies in
the present-day mindset of too many: Conditioned thinking based
solely on what has been done in the past with hardware. Some
hobbyists are fixated with the past and actually refuse to consider
any other way to do something even if it is demonstrated in front of
their eyes and ears. Trying to experiment in a closed-mind
community is a rather unproductive and frustrating exercise. :-)

A small example of system groundbreaking is G3PLX's PSK31
in which Peter fairly well reorganized character coding such
that, as a part of the whole and not solely by itself, it made the
resulting bandwidth very narrow. Those who could not educate
themselves beyond manufacturer's sales phrases refused to
believe it or tried to thrash the whole idea. Not unlike the
antipathy displayed against SSB voice v. DSB AM in the 1950s.

Another example which will become more prevalent in the future
is the DTV format in TV broadcasting...the ability to squeeze 18
MHz of video information into a 6 MHz RF bandwidth and ALSO
have room for multiple-channel audio, closed-captioning, and a
number of other features. All that while delivering a snow-free,
noise-free signal right down to threshold.

Now expect some deragatory commentary such as "TV
broadcasting is not done in ham radio!" or nasty remarks
about PSK31 by those who have a stubborn hold on the past.
They will not, indeed cannot, accept something new and have
great difficulty seeing beyond the labels to the system itself.
They cannot understand, nor will they understand that
general communications theory allows bandwidth compression
and elimination of redundant information without loss of the
basic information to be communicated. Bandwidth compression
exists In both examples I just cited...as it does in the data that
is transmitted and received over the Internet for this newsgroup.

The Standard Argument AGAINST will surface as "That's not
the way it is done in ham radio, you <explitives> !!!" :-)

>
>FHSS and DSSS have no meaning to those not familiar with spread spectrum.
>You should avoid using "industry insider" terms without defining them.

"Industry insider?" The terms "hop set" and "hop sequence" are in the TMs and training aids for U.S. military communications folks using the SINCGARS family. The family was put into operational use in 1989. Since SINCGARS is for small unit operations on land, it would be safe to say that a few ten thousands of radio operators in the military have become familiar with the terms.

Hop Sing is the character name of the cook on the old TV show "Bonanza." :-)

>Also, I
>couldn't care if it's a direct sequence or another pattern - because the
>actual pattern doesn't matter when one is considering on what frequencies it
>COULD go to.

That seems to be reducing the argument to absurdity (reducto ad absurdum). Almost any misused HF transceiver COULD be made to transmit well out of band, rather in excess of manufacturer's claims, ARRL lab reviews, or even FCC type acceptance. :-)

>If it makes you happy, Len, I drive a bus as well and I have TWO degrees
>including a Masters.

I'm sure you drive very well. My wife has three degrees and TWO are Masters but her driver's license is standard passenger auto rated and dislikes driving in traffic.

All of the degree certificates we have are in a box in storage in the northern house. In frames, of course. Should we have the four protected and mounted on plaques on the wall with little spotlights shining on them? :-)

>I did my cubical rat thing for 25 years and am about
>a year from collecting a nice retirement check and tapping a 6 figure
>IRA/401k.

Is that a "qualification" of any kind for what is essentially a hobby activity in radio?

>I drive because I want to: as Larry points out is it a useful,
>low-stress occupation that pays decently. And I have nothing to prove to
>you or anyone else.

No, I think that incorrect. It would appear that you DO have something to prove. That is evident in past remarks made in this (now) chat room. "I was BORN an Extra" is one of the memorable remarks in attempting to put down "lesser" hobbyists in here. Add to that some literary pretentiouness creeping in from time to time that is more suited to Sunday Supplement Book Review or Weekend Calendar sections.

I've spent most of my adult life IN radio and electronics yet a number of one-by-twos in here resent the hell out of that because I don't adhere to any "traditional" amateur radio party line phrasing of self-glorification in accomplishments.

>Years ago I ate at the Blackhawk Cafe in the Chicago Loop with a group
>that included a PhD garbage man. He got the biggest chuckle out of
>wondering what the yuppies at the next table would think about eating with
>a G-Man. He had nothing to prove either.

Name dropping about restaurants? :-) Having been born and raised 90 miles west of Chicago, I can name-drop "The Loop" (it is said that way to outsiders who've never been to Chicago)

and "The Outer Drive" with ease. Why? I don't care for the central area of Chicago. I don't care for the Center City area of Los Angeles either, but know it better. None of that has any bearing on anything, does it? :-)

I've WORKED with PhDs, some of which were fine folks who didn't mind getting their hands dirty in electronics hardware (rather than garbage). Some of them were pretentious assholes who wore their "I can sign 'doctor' in front of my name" as if they should be revered as gods. The unpretentious ones got the work done. The pretentious ones were too busy making themselves lofty to do much innovation. Great appearance, though. :-)

I HAVE a number of things to PROVE. The main one in here is to dispell a host of mythology that has grown and flourished in minds of amateur radio licensees and their insistence that their fantasies MUST be taken up by newcomers and propagated because THEY insist that "that's the way it is."

Now, if that is upsetting to the pretentious credentialists, TS. The pretentious credentialists HAVE EARNED THAT OPINION. Think about it.

Not at all. It is my opinion that you are characterizing the trailing edge rather than the average. "50 years behind" were your words. That is an utterly ludicrous characterization of the 'mean'. You obviously need considerably more data to reduce your standard deviation.

Ok, but what is the "first line" of information regarding any product in general? Isn't it the PACKAGING? The second line would then be product reviews, ... , and lastly, the "standard" (although some standards are more standard than others) that it claims to follow.

My whole point here has been: One applies common sense to what one has available, and the packaging for the LAN stuff, without the detailed knowledge from secondary and other sources, brings one to the wrong conclusion about suitability for amateur operations.

How so? I think it's fair to say that the average ham spends
most of his/her time either on CW or SSB ... SSB is over 50
years old ... not at all near commercial state of the art ... CW,
well that's pracatically got dinosaur dung on it it's so old,
technologically-speaking.

I think I've painted a reasonably accurate picture of the "average."

> > As far as the leading edge goes, my concern is that it is

I don't have a bad attitude towards ham radio ... I like it and
value it ... that's why I'm so concerned about what I believe to
be a very negative trend in our "average" relative to the state
of commercial practice ... since the commercial folks would
LOVE to have a chance to bid at auction on quite a few of
our bands. (And I don't believe that our HF bands are totally
"safe" either.)

>general? Isn't it the PACKAGING?

Yes, the packaging on a new Yaecomwood tells us that a unit is an HF
transceiver. But what tells us that it does not transmit simultaneously on all
of its frequencies.

If you feel that the package should contain all of the information you need to
know to operate something, I disagree.

> One applies common sense to what one has

Yes, I agree; without common sense and knowledge, one can draw the wrong
conclusion from the marketing information that most companies put on the box of
their products. One should not buy a product unless he or she has at least
some common sense and knowledge about what that product is.

>1) There are lots of 2-way electronic communication "hobbies"
> besides ham radio today. Back in the "Novice heyday" a teenager had
> very few other options

I am not sure I buy into that. Considering that over the course of the development of these lots more hobbies, the percentage of hams wrt the general population has grown, obviously more hams of some age are entering ham radio. Considering that all of us hams are big kids at heart, the factor you describe should apply as much to the 30 year old as the 13 year old.

>2) Antenna restrictions and RFI concerns make ham radio difficult or
> impossible for many young people.

Other than the factor that people <30 are probably more apt to rent an apartment, where antennas might be forbidden than people over 30, who are probably more apt to own their own home (CC&Rs notwithstanding), the 13-year old is not apt to have any more or less problems than the older ham. In fact, when you consider that the parents of most 13 year olds are over 30, the 13-year old will be like I was -- living at home and putting up an antenna at the folks' home.

As to RFI, interference to consumer equipment is under much better control than it was when I was hamming. With industry standards for immunity just now coming into play, the inherent shielding of cable TV (not perfect, but a whole sight better than over-the-air TV) and much better information about RFI than when I was a young ham, I don't think that RFI is a major impediment.

>Many 13 year olds today can't put up any kind
> of antenna, even if they have the yard and antenna.

The same restrictions apply to the 30 year old.

>3) Lack of publicity (relates to 1))

When I was 13, the ONLY way I learned about ham radio was from the old time ham who moved in next door. Today, I can find all sorts of information and publicity about it using any web search engine.

>4) Perceived high cost of getting started. (note "perceived")

I am not sure it is perceived. By whom? Most hams today realize that the cost of all electronics has decreased in real dollars. For $1000.00 I can buy capability that I never would have dreamed of in the 1960s.

>But let's fix what can be fixed. See the "S25.5 proposal proposal" thread
>for some ideas.

I have contributed my ideas. I think it is great that we are talking and thinking about it, because the day will come when Amateur Radio will ask the Commission to make a decision about change again.

Jim, I can remember being truly shocked as a newbie on this newsgroup. I never expected that people on a newsgroup would act just as they go, generally, online with each other in a common chat room. So, been there-done that-threw away the t-shirt. When I began responding to the first posts I noticed here about the CW issue (remember, I found this newsgroup a few months before the Biennial Review process was over with), and was summarily sworn at, called dumb, etc., etc., I responded in kind. I would in real life, also, or I would just walk away for fear of dealing with a lunatic.

It is not Dick's point about CAW that I met with chagrin, Arnie. There's a
couple of things I take issue with that he said:

1) "It's a matter of being prepared for operation with the minimum level of
technical support.

My counterpoint to this is what least technical support is needed when the
most widely used form of communication (voice) is implemented on a net? I
understand that Dick is talking equipment support when he says "technical."
HOWEVER, equipment aside, the quickest most easily understood form of
communication is actually voice--very little technical support needed to
just plug in the mic and squeeze the PTT.

2) The best possible way to be prepared is to have the maximum number of options.

My observation on this is that if we are to use "the maximum number of options" as the basis for being prepared for an emergency, then my questions to Dick above stand as asked. It is impossible for someone to be "fully" prepared for an emergency or disaster. It is absolutely the best message that we can give that you should be as prepared as you can be in the area of your most passionate interest. It is up to the leaders in disaster communication to know his/her group's capabilities and plan for every capability they have. If I have nothing but voice operators in an emergency response group (and I should not have to ask, either, I should *KNOW* my team's capabilities), then I train never mentioning *any* other mode; and I prepare for methods that would work best using voice. If I have nothing but CW operators, then I, well...you know...train and prepare for methods that work best using CW. If I have both, and more mode capabilities, I do the same.

For the sake of argument, I respond below to your observations about what Dick C. said (then see my note at the very bottom).

While it may be that most rigs are equipped to handle CW--most people are not, for one. I don't know what the percentage is for people, who are capable and willing, to operate during an emergency or crisis and are also CW literate. But, I can tell you that most I know and deal with are not. So, to placate N2EY, I will make the statement that here in my *local* area, there are two things wrong with Dick C.'s voracity:

1) Most emergency nets in this area are conducted first on VHF/UHF, with some traffic handled on HF, via voice

2) Most every time I have ever heard of people talking about emergency responses, prior to my becoming a ham, there is no mention of CW nets or communication that were established, but plenty of discussion for voice nets

And, speaking in general terms:

3) Most CW capable rigs are also going to require power capabilities that are much harder to meet the more disastrous a situation is. With few exceptions, HF capability is going to entail far more power requirements than VHF/UHF will. At a minimum, to get operational on an HF net, a generator is going to be required for any length of time, right? (Correct me if I'm wrong--I am definitely *not* HF capability savvy).

4) Most people who don't care for the CW mode are also (ironically enough) involved in emergency communication of some sort

5) CW is a, generally, outmoded form of communication--with other just as easily established digital modes taking over (PSK, etc.) If I understand, for instance, PSK31 correctly, it is just as easily "hooked up."

> One analogy I can think of would be using a vacuum cleaner. We could lift

> Home of Walt's World on the web
>

Plus, Arnie, while Dick C.'s platform facilitates friendly discussion between others (such as you and I are capable of), Dick generally approaches this topic with a demeaning attitude toward others. It sets the stage for "competitive response" right off.

Not this member. I'd just as well not get QST. But, after a few years of resisting because of local ARRL stuff, I am now proud to support the national HQ. I just hope one day that more local ARRL stuff will happen/be corrected around here--it would no doubt add to the membership levels.

Didn't say that. My point in this discussion was that a) tuning on the air
is "OK", and b) the newsgroup probably isn't a good source for ascertaining
percentages of the way people do it. The rest of the matter was so far
above my head, I couldn't get interested if I tried. :)

> >
> >I'll tune with a carrier.
>
> What rigs do you have that require being tuned up in the first place?
> >

Just a Yaesu 890FT/AT, which actually tricks the antenna; however it still transmits as it "tunes." I used to have a Kenwood 520-S, and tried three times to tune it, traded it for a Radio Shack 440 HT. Before ya get all "well, you don't know the value, blah, blah, blah," I bought the Kenwood for $150.00. I *needed* a 440 rig, I didn't *like* the Kenwood. And so on. The rig, I think is still on the air with KY9Y.

> 73 de Jim, N2EY

Once again you pop in with some qualifier that I missed. There's nothing illegal about tuning on the air, Jim. It's a given that one should do it within legal limitations.

By the way, a giggle for you (can you giggle?). See a post later from Jim Kelley (at the thread ???for Mr DX). I tell you that the exchange was pretty silly. He actually posts and says "But at least you kept replying until you finally had the last word in the exchange. :-)" The irony is that, no, *HE* actually had the last word...ROFLMAO...

Previously explained and acknowledged, tnx. HW-100/SB-201 was a decent
setup for the money. You build 'em or buy 'em built?

>I had a Heathkit KW amp but I sold it.

The SB-200 and SB-201 were rated 1 kW CW and 1200 W PEP SSB. Which is
the max ratings of a pair of 572Bs. The introductory price of the SB-200 was
$200, which meant a lot more hams could run high power 'phone.

Its pi-net was only rated for 2:1 SWR, though.

I'm one of those "slowcode" people with a grandfathered tech+ who doesn't want to join NCI. If anything, I'm entertaining the idea that there should be MORE mode-specific testing, and possibly break the licenses out into specific mode priviliges, perhaps based on bandwidth usage.

have a base license class covering RF safety, then add on modules for voice, CW, RTTY/FSK modes, image... for each module added, add new questions relating to mode specific operations. and top it all off with some kind of "unlimited / experimenters" where you actually have to demonstrate that you understand time/frequency bandwidth relations.

it's attitude towards stodgy status quo, towards "CW and SSB forever"
types.

it is hypocritical to claim that the ARS is advancing the state of the
technology when the primary technologies used haven't changed or been
updated in 50+ years, and not for lack of opportunity...

a DSSS system COULD do the above. but a DSSS system labeled as
"802.11b" DOES NOT.

> Generally, these items simply say "SS" and don't tell us how or which

I was only arguing for authentication. the content of the messages
themselves would still be in the clear, similar to carl's usenet posts.
anyone can still see the content, but more importantly, anyone can
verify that the contents are from who they claim they are. for
authentication you need strong encryption OF THE SIGNATURE ONLY. not
the entire content.

there would be no need for key escrows... the station could transmit its
public key periodically with its callsign, perhaps.

>Ameritron amps are like that today. Why would anyone spring for
>a $400 external tuner when the pi-net tuner is built in?

Bunch of reasons:

1) Lowpass filters doesn't like much SWR
2) Although an amp may be rated for "2:1 SWR", some loads may stress the
output network a bit more than desirable.
3) It may not be possible to get the load impedance to a point where the pinet
can match it
4) The amp may not be used all the time, in which case a tuner is needed for
the
exciter. If the exciter doesn't have an ATU, why not buy one tuner and be done
with it?
>
>Of course, I don't have that problem since the impedance seen by
>my SGC-500 amp is always between 25 ohms and 100 ohms.

Sure - your "tuner" takes the form of linear rather than lumped elements. Which
has advantages and disadvantages.

A wide range, low loss, balanced tuner can be easily made from just a pair of
coils (roller or tapped/switched) and a single variable capacitor. For a balun,
just wind coax on a piece of
PVC pipe (space the turns and secure with tie-wraps). Simple.

>I am not sure I buy into that.

What other 2 way electronic communication "hobbies" existed for the teenager of 1962?
Back then there was the telephone (usually shared with the entire family), various unlicensed
short-range devices like phono oscillators and 100 mw walkie-talkies, and ham radio. 27 Mc.
CB was just getting started and required a license not available to a 13 year old.

No computers, no internet, no cell phones. Heck, most people didn't even have color TV.

>Considering that over the course of the
>development of these lots more hobbies, the percentage of hams wrt the
>general
>population has grown, obviously more hams of some age are entering ham radio.

The question is about 13 year olds getting into ham radio today vs. back in "the heyday of the
Novice license" - whenever that was. Dig out yer old QSTs or my article on US licensing history,
and you'll see that from the end of WW2 to 1962, the number of US hams grew steadily from
~60,000 to ~240,000. That's a quadrupling in 16 years, or almost double-digit growth EVERY
year for a decade and a half. Then in 1963 the growth suddenly stopped and the numbers stagnated
at around a quarter million for almost a decade. How come?
>
>Considering that all of us hams are big kids at heart, the factor you
>describe
>should apply as much to the 30 year old as the 13 year old.

Not really. Most 30 year olds today remember a time before a computer on every desk and a cellphone

on every belt. Most 13 year olds do not.
>
>>2) Antenna restrictions and RFI concerns make ham radio difficult or
>> impossible for many young people.

>the folks' home.

The percentage of the 13 year old population living in antenna-unfriendly
situations is MUCH
higher today than in the '60s. They are much more likely to be told that they
cannot have
an antenna, period. The 30 year old may decide to operate mobile, or move - the
13 year
old doesn't have those options.

>As to RFI, interference to consumer equipment is under much better control

Not everyone has cable, and TVI is not the only RFI. Plus it works both ways.
>
>>Many 13 year olds today can't put up any kind
>> of antenna, even if they have the yard and antenna.
>
>The same restrictions apply to the 30 year old.

The 30 year old can usually operate mobile, or decide to move. The 13 year old
can't.
>
>>3) Lack of publicity (relates to 1))
>

The old time ham next door probably had a very visible antenna, too.

I discovered ham radio because I found an old ARRL Handbook that
somebody had given my dad for some forgotten reason. Tube info for
his hi-fi, I think. The library had more books and the local radio store had

more.

The Handbook that I found showed how to build simple, inexpensive radio sets and use them on the air. That's what hooked me. Couple of EE degrees later and I still have the old book.
>

>
>I have contributed my ideas.

That's good.

>I think it is great that we are talking and
>thinking about it, because the day will come when Amateur Radio will ask the
>Commission to make a decision about change again.

That's the wrong way to go about it. We should develop a coherent plan, build a consensus and present it to the FCC. Be proactive, not reactive, and all those '90s
buzzphrases. In short, give the FCC a workable plan on a platter.

I gathered and still have all the parts for one but with my present
matching method, I just don't need a tuner.

> (And I don't believe that our HF bands are totally
>"safe" either.)

They are probably safe from additional formal allocations, at least for the most part. Part 15 devices and uses already can occupy our HF spectrum. The biggest HF threat will continue to come from power-line noise, digital devices and increasingly, from various high-speed networking devices, similar to VDSL, HomePhone Networking and HomePlug devices.

So far, we have been lucky. The above-mentioned industries have been made aware of the interference potential from their devices and have included some protection for the ham bands in their standards and specifications. The unknown at this point is "access PLC" -- a technology that seeks to use utility-owned power lines to provide ISP services to residences and businesses. They lack the umbrella organizations such as the TIA, Home Phone Networking Alliance and HomePlug, so Amateur Radio has not been able to make the inroads with them that I have made with the other groups and organizations.

>What other 2 way electronic communication "hobbies" existed for the teenager
>of
>1962?

>CB was just getting started and required a license not available to a 13 year
>old.

That was the heyday of CB. I don't know the rules, but I knew of several 13/14 year olds that were active on CB, using their FCC-issued call letters. That call may have been issued to older family members, but apparently, that was not all that uncommon.

It is clear that the effects of multiple 2-way electronic communication hobbies are not affecting growth of Amateur Radio, so obviously, people of some age are joining our ranks in spite of those effects. Why do you believe that they are reducing the ranks of teenagers entering ham radio, but not affecting the ranks of older people?

> Then in 1963 the growth suddenly stopped and the
>numbers stagnated
>at around a quarter million for almost a decade. How come?

Some will say that incentive licensing was a failure. :-)

>The old time ham next door probably had a very visible antenna, too.

It was a windom up about 20 feet. He asked me to put it up.

>Sure. But most 13 year olds aren't going to spend $1000 just to get started.

I spent $200.00 in 1963 money to get started.

>usage.

One of the values of having broad-based testing is that the applicant can then decide to use and experiment with any available mode at any time. If we had mode-specific testing required before a ham could use a new mode, I think that would tend to discourage, rather than encourage, the use of new modes by hams.

Thats what I said..... unless you consider 6 meters a HF allocation. In all
of the material I have, 6 is a VHF band. Guess it is a matter of semantics
eh?

>
> Unless you are working one of the super stations, 1500 watts is needed for
> conventional moonbounce. Some hams have recently been experimenting with
> long-term integration to accomplish moonbounce at QRP levels, though.
>
True, a good percentage of hams do not do moonbounce, but there are some
that do. Overall, anyone needing to perform communications on 6 meters
through the centimeter band ranges can sufficiently communicate a
"reasonable" distance with 200-300 watts as a max. As far as "working DX"
that is not concern, as most of the DX activity is not attributed to that
region of spectrum. Granted there is band openings but usually those bands
are more for "local" communication, whatever your definition of local may
be. I will, regardless of frequency usage, never use more that 200-300 if
that is what is necessary to establish communication. Also, the cost and
power sources necessary are major limiting factors even if I wanted to run a
full 1500w. 95% of my amateur radio activities are related to public
service activities, and the training for emergency comm's if the need arises
in the future. Fortunately we have be really luckly locally speaking. But
with plenty of training, and performing drills/excercises, hopefully we will
be ready. With local ARES groups being nothing more than an old fart chit
chat group, I am looking towards establishing something better. I have seen
some groups in other area's that would astound some ARES groups. Again, my
attention to ham radio is the component of public service/emergency related
activities, so how I view various things discussed here and elsewhere is
based on that type of slant.

> >I would support a entry level of licensure that would give a taste of 1
HF
> >band, say like 10m and say 2 meters.
>
> If you limit the entry level too much, no one will want to play.

That may be true, but overall it seems like it may present a happy medium. All the old farts (pro-code) bitching about "how things used to be" will have their way, and also the (con-code) people will have something to use until they find whatever they want to do with going further in the hobby. Sure, some will be lost due to lack of ambition, but that has happened over the past 20-30 years anyways. If I had a dollar for ever person who has admitted they didn't utilize their license much after testing, or just let it lapse, I would have enough to start a really decent station. (If I had a dollar for every person who sat around and bitched and moaned about the problems in ham radio, and DID NOT DO ANTHING for positive promotion or positive change, I would have the best station anywhere.)

Interesting side note there Ed, we have 2 new prospects for recruiting new hams in our area at least. Email me if you want more info. It is something that could be implemented in many more areas! :)

Cheers!

Ryan

I believe what Ed is saying is that not only do techs have all VHF/UHF
privileges but they also have *ALL* EHF privileges. Your statement
is wrong because you didn't include frequencies above UHF.

I don't think many radio amateurs resent you for your stated reasons at all. I think you are resented because you are a non-ham lacking in any amateur radio credentials but long on opinion. You don't have any "traditional" amateur radio party line because you aren't a radio amateur.

Let us know when you finally achieve newcomer status. Until that time, all of amateur radio will remain a fantasy to you. We'll stick to doing what we want. You may do what you can (nuttin').

Agreed. To test for the specific mode would be difficult for the FCC,
and wouldn't it be a blast to have to fork over more money for another test!

Wanna do PSK? First go to ARRL or Radio Shack, and buy a copy of "Now
You're Typing!" Study the guide, and demonstrate how to hook up the
appliance interface between computer and rig.

Next demonstrate that you can type at least 5 words per minute with
less than 2 typos.

Purty strange.

The whole idea was to allow amateurs, after passing a minimum standard,
to go out and have fun and learn stuff at the same time. Best way to do
that is by doing it, not studying it.

Read the 2.4 GHz DSSS PHY section in 802.11 (it is 30 pages). The advantage
of standard hardware is that the standard fully defines what is supposed
to come out of the RF connector.

>schematics. This example is not comparable.

If you want schematics and full documentation, buy a reference design
eval board from Intersil or one of the other chip vendors. Or buy a
card from one of the dozen or more manufacturers using vendor silicon
and reverse-engineer the card using the chipset data sheets. Of course,
I doubt that even the service manual for a Motorola radio would help
if you didn't know what an FM radio was, which is sort of equivalent
to the state you're in if you won't take the time to learn what comes
out of the RF connector of an 802.11b transceiver.

I think the point still stands. If you are adapting equipment from
another service for ARS use then you can't expect to be able to treat
it like a plug-'n-play appliance. Your license lets you put all manner
of equipment on the air, but makes you (not the manufacturer) responsible
for ensuring the equipment complies with the regulations of your service.
If you aren't very clear on what is coming out of the RF connector
(this isn't a secret, the equipment implements a standard) then
manufacturer labelling which encourages you to leave the device on
the store shelf is probably a feature. You should leave it there
until some other amateur who takes the time to understand what it's
doing gives you cookbook instructions which keep you from doing bad
things.

>
>How many people have time to read 1,000 page documents? Only those who are
>retired or don't need to work even have the potential for such time.

The only difference between 802.11 DSSS and 802.11b is a speed difference;
both have the same channels, 802.11b just adds a more exotic modulation.
The DSSS PHY section which defines what comes out the RF conector, is
30 pages in 802.11 and under 50 pages in 802.11b. Reading either one
will do. If you can't invest this much time to learn how it works then
you probably aren't the one to be adapting the device for use in the
Amateur Radio Service. Icom and Kenwood don't sell this kind of gear
so you'll probably need to wait for another amateur to help.

That "advancing the state of the art" crapolla died years ago. But
then again how long ago did 100% ham-developed PSK-31 first pop up in
the RF spectrum?
>
>
The only "new technologies" being tossed around here are campaction
schemes which are NOT new modes. With 90% +/- of the ham vhf/uhf bands
dead spectrum space who cares about "compacting" those comms into even
less spectrum space?? Are YOU gonna pay for the infrastructures
required to implement those schemes? I thought not.
>
>
CW, FM and ssb WORK given the realities of what ham radio is actually
all about. It was a bunch of old farts who brought ssb into the HF ham
bands which mode all but completely replaced strongly-entrenched AM
over a period of 8-10 years. They created a model which is still quite
applicable today as it relates to The Herd adopting a new mode, any
new mode. The basic general nature of hams and their value sets have
not changed one bit any more than has the basic general natures of the
population at large changed in the past half century. Or from the days
of Moses and before for that matter.
>
>
The switch from AM to ssb was due to the whole litany of advantages it
has over AM. Cost, effectiveness, all the usual primary parameters
hams care about. But it had to be demonstrated by the pioneers who did
put it on 75 & 20 and finally convinced the stodgies to jump on it.
And they sure as hell did huh? THAT's the model which worked then and
it's the *only* model which will work today.
>
>
So here we be in RRAP which is overloaded with far-end techos bitching
about hams in general not adopting any of the myriad of the brainfarts
they have in mind and looking down their noses about the "average ham"
as being a no-clue Luddite.
>
>
Wake me up when any of the "geniuses" around here gets off his
keyboard and his dead butt and actually puts his pet brainfart on the
air and exposes it to the ham market realities of acceptance or
rejection by The Herd. Until they put the requisite effort into doing
what the ssb advocates did back when they got NO bitch on ANYBODY in
ham radio for not buying into any of their "visions". Core stuff: Like
put up or shut up. Ask me if I'm holding my breath.

To address the discussion on another newsgroup (cross-posting added) and this above comment to Carl Stevenson about part15 on 12cm: Gee - I wonder how he came to that conclusion? He must have read the box! As I have said, there simply isn't enough information out there for the non-radio-engineer amateur operator to realize that this belief is technically wrong - because the fact of a 20MHz slice of the band isn't evident to those who don't take the extraordinary step of looking up the IEEE 802.11b specification.

I discount you because you are involved in the design and/or manufacture of such devices. I discount Ed Hare because he is involved in the survey and testing (for interference purposes) of all wireless devices. [However, both of you seem knowledgable on the subject, but you are EXPERTS.] I have been talking about the AVERAGE PERSON. Not every amateur operator is an electronics

engineer.

True. HF doesn't allow SS. Now, if the packaging said that it was an HF SS transmitter (assume that such is allowable for this example), one COULD PROPERLY assume that it MAY transmit on every allowable frequency in the band(s) unless it said otherwise (or research to a secondary source was done - that turned up that such was not the case).

That's my point. There's been no effort by these manufacturers to let a non-trivial secondary market (the amateur community, which has been starving for high-speed access in a "land dominated by 1200 through 9600 baud devices") know of the suitability.

Also note - in another thread (now cross-posted here), someone else recently commented about 11Mbps 2.4 wireless lan stuff being "unsuitable for going out of band" for amateur use.

Interesting. You seemed to find at least ONE product that DID say that it could be limited. I hadn't seen that one when I last looked at the wireless lan stuff in early 2000 when I wanted to attach my laptop to my in house network.

Had that been among the boxes I had picked up and read, we wouldn't be having this discussion. However, that product might be the exception, not the rule.

Yes, exactly. This started by someone saying that it was suitable, while the information I had at the beginning gave the opposite conclusion, and apparently, I'm not the only one who arrived at that conclusion.

Writing a double negative can be confusing to the reader, Cecil. (Never not
= Always) Since we can read as fast (and sometimes faster) than we can
speak, it is quite easy to transpose or skip a word and lose the meaning.
Steve made an honest mistake if you ask me.

"KC8PMX" wrote in part ...

"... 95% of my amateur radio activities are related to public service activities, and the training for emergency comm's if the need arises in the future. Fortunately we have be really luckly locally speaking. But with plenty of training, and performing drills/excercises, hopefully we will be ready. With local ARES groups being nothing more than an old fart chit chat group, I am looking towards establishing something better. I have seen some groups in other area's that would astound some ARES groups. Again, my attention to ham radio is the component of public service/emergency related activities, so how I view various things discussed here and elsewhere is based on that type of slant."

My mileage varies quite a bit. Our local ARES group is very prepared and has performed well on each and every SET drill that I have been aware of. We don't do a lot of "Chit-chatting", but rather get down to business. (even with the apparent burden of having Old Farts aboard)

" That may be true, but overall it seems like it may present a happy medium. All the old farts (pro-code) bitching about "how things used to be" will have their way, and also the (con-code) people will have something to use until they find whatever they want to do with going further in the hobby."

So it is your opinion that Pro-Code Hams are the only ones capable of bitching about how things used to be? Hardly. Give a listen to HF SSB on any given night. Some of what the OF's on voice (and are NOT pro-code) have to say about No-Code techs would hurt your feelings.

I am always amazed at the attitude of those that think that *anyone* that likes CW must be some kind of a knuckle dragger incapable of entering the 21st century. I've worked emergency communications / public service from day one of my entry into the ARS. I've used VHF and HF voice/CW to that end. We have an excellent ARES group and EOC which includes operators of all license classes and ability. We don't look down our noses at the No-code techs, and they don't refer to us as Old Fart Pro-Coders. We work together as a team --- Get it?

Besides --- I'll bet that I have converted more Hams to add CW use to their ARS toolbox than you have converted CW capable hams to exclusive VHF use. Care to put a friendly wager on it?

Would you really assume that an HF transcevier that was capable of SS would
transmit on all HF frequencies at the same time? Even that it would transmit
SS on an entire band at the same time? Would you assume that it is not
programmable in any way? Would you really expect them to put all that
information on the box?

The IEEE 802.x standards sort of divide stuff into two "layers", the
media access control (MAC) layer which generally deals with definitions
and processing of bits in packets that are sent, and the physical (PHY)
layer which generally deals with the physical medium, formats and coding
used to get the packets from one place to another.

The 802.11 standard defines 3 different, incompatible optional
PHY standards (I think; I'm working from memory) over which its MAC
layer can run:

- a 2.4 GHz DSSS PHY layer. This runs at 1 or 2 Mbps, spreads the
signal to a width of 20 MHz and has user-selectable channels.

- a 2.4 GHz FHSS PHY layer. This runs at 1 or 2 Mbps, and has
user-selectable hopping sequences. This hops over the full
available bandwidth (though how much bandwidth this is varies
from country to country).

- an IR PHY layer. I know of no products using this.

The 802.11a standard adds a PHY layer using OFDM coding running at
speeds up to 55 Mbps in several bands in the 5 GHz region.

The 802.11b standard adds a 2.4 GHz DSSS PHY layer running at 5.5
or 11 Mbps. It uses the same signal bandwidth and channels as
the original 802.11 DSSS PHY, and falls back to the original 802.11
behaviour at 1 or 2 Mbps when conditions prevent running at higher
speed.

The distinction is hence between the FHSS and DSSS PHYs, not between
802.11 and 802.11b. The 802.11 FHSS PHY hops all over 70 MHz in the US,
but 802.11 DSSS had the 20 MHz channels and 802.11b is just an upward
compatible speed upgrade for the original DSSS PHY standard. Note that
the DSSS option for 802.11 was always more popular than FHSS even prior

to 802.11b, so most 802.11 cards also had channels.

I don't remember anyone contradicting this. If there was some fixation on 802.11b it might only be because you didn't seem responsive to the significance of the distinction between 802.11 DSSS and FHSS. 802.11b is unambiguously DSSS, while 802.11 might be either.

>know of the suitability.

They are going to sell these by the tens of millions. How many do you think they will sell to Amateurs? Again, one should not buy a product unless one is willing to find out what that product is. Doing so is very easy, although not quite as easy as having them print on the box the small subset of the standard that you don't want to have to read.

>Also note - in another thread (now cross-posted here), someone else recently
>commented about 11Mbps 2.4 wireless lan stuff being "unsuitable for going out
>of band" for amateur use.

Correct. If one selects one of the upper channels, at least part of the transmission will be out of the Amateur band. They didn't put that on the box, either.

Or the much less extraordinary step of readihg one of the short tutorials on
the subject.

Has Amateur Radio really slipped that far down that hams feel that they should
be able to learn everything about modifying the use of a product for Amateur
use by reading the marketing information on the box? :-)

> [However, both of you seem knowledgable on the subject,
> but you are EXPERTS.]

Expert on IEEE 802.11b? Not me! I was a bit interested in the subject because
these devices operate on ham bands and I wanted to learn a bit about them for a
number of reasons. But I am far from an expert; I just read the short
tutorials. :-)

FYI "You Know Who"

QUOTE from ARRL Web Page

New RACES Amateur Radio station open house gets positive media buzz: The Glendale (CA) Emergency Amateur Radio Service (GEARS)--a RACES group--held an open house January 16 to celebrate its extensively remodeled WC6AAZ ham station in the Glendale City Hall's Emergency Operations Center (EOC). The event attracted attention from several news media outlets, including the Los Angeles Daily News, the Glendale News Press and KNBC-TV, channel 4. "We've also been interviewed by the City of Glendale's monthly newsletter, City Views," said ARRL PIO Michael Benner, N6IJR. A GEARS news release pointed out how the group's "monthly meetings, drills, and training sessions" at the EOC had prepared GEARS to assist when a construction accident left Glendale Memorial Hospital without telephones last March. Invitations to the GEARS open house also went to all amateurs in Glendale as well as to city officials. The GEARS news release quoted City Radio Officer Jim Olliff, KE6URZ: "You never know when or where regular communication may be interrupted for any number of reasons. Historically, ham radio volunteers have proven their ability to provide reliable back-up channels of communication in emergency situations." WC6AAZ works with the Los Angeles County Sheriff's Disaster Communication Service (DCS) and the California Governor's Office of Emergency Services (OES).

>
> Ok. Sounds reasonable. :-)

Well, I don't know how "reasonable" it is, but it's the best I can come up with. I remember an old friend and I discussing on many occasions the ways in which people deal with each other online. This was back when I first got online, and there was a chat program called PowWow. It's still around, from tribal.com, but it's become a money-making venture now and is no longer free. Anyway, back to the point. Her and I would go a "monitor" this chat room. People were territorial, bashed any newcomer into the chat room, had "private" parties (if anyone tried to start talking to someone at a party and they had not been invited, they'd get hit with something called Nuke; which would immediately knock them off the air). Leslie was far more prone to late night observing, and she noted that these people (the "regulars" as they called themselves) were online almost 24/7.

Her and I came to the conclusion that many were probably lower class or poor; handicapped; or had some other malady that inhibited them from interaction with "real" people in "real" life. However, we could never figure out the mentality that makes people, including ourselves (Leslie and I) act quite more aggressively online than normal.

Interestingly enough, I have observed that--while it happens less on the ham bands--the same behavior can be witnessed on radio interaction. For instance, and this does happen on CB quite frequently, there is onair arguing of almost a warring nature, and I have heard of people going and shooting the coax of other CBers, etc.

What do you think? I think it's fascinating.

As I recall, cb licenses had an age requirement of 18 years. Of course lots of kids used their parents' sets, but if a kid was interested and the parents weren't,
he could not get a license.

>It is clear that the effects of multiple 2-way electronic communication
>hobbies

>
>Some will say that incentive licensing was a failure. :-)

They will be wrong. The growth stopped in 1963 but incentive licensing did not begin until very late in 1968. Using that logic, the lack of growth in the mid 1990s
could be blamed on the restructuring of 2000 ;-)

>>The old time ham next door probably had a very visible antenna, too.

GOOD POINT! Thanks!

Both the size and cost of the "entry level" study guides may dissuade some
prospective hams.

> What Techs
>> get for their effort is ALL VHF/UHF at 1.5 kW power, but extremely limited
>> HF/MF.
>
>Last I checked, techs now only have VHF/UHF privileges.

Let me restate:

Technicians without a code test get all amateur privileges above 30 MHz but
nothing below 30 MHz. Add a 5 wpm code test and they get extremely limited
privs below 30 MHz. That's unbalanced.

> Although they may
>have privileges of up to 1500 watts, I do not see why that level is
>necessary. At a maximum of 200-300 watts should allow communications with
>another station just about anywhere in any state, on any of the bands from
>50Mhz on up as far as mobiles are concerned. And residential setups with a
>decent antenna system should definitely have better luck there.

All depends what one wants to do. The main problem I see with 1500 W for Techs
is what it does to the testing. Lots of RF safety questions, which of necessity
crowd out other stuff. Most beginners aren't going to run anyhting like that
power
anyway, and those who do want to use it won't be dissuaded by more written
testing.

>> Only tiny slices of four bands, and only two modes! I think the "entry
>level"
>> license
>> should allow more spectrum and modes but less power. Remember, RF safety
>was
>> not a concern back when the structure was created.
>
>I would support a entry level of licensure that would give a taste of 1 HF
>band, say like 10m and say 2 meters.

Why so limited? I say give 'em nice slices of all the bands and a bunch of
modes
to boot.

> Then have the General, Advanced and
>Extra Class licenses testing go back to what it was 15-30 years ago.

Not gonna happen. The VEC system saves the FCC tons of money and effort.
They get unpaid volunteer hams to do FREE what used to cost serious tax
money. Think the FCC wants to run ham tests again?

>What
>to do with all the various licensees during the changes of the past 20 years
>or so, I don't have the solution to that, but making them upgrade to General
>as a minimum seems like the only solution. Who knows.....

Simple:

Keep the license names and most of the privs. Shift around some subbands
and expand the Tech HF stuff.

The new power limits would go into effect on a certain date, coincident with
new
tests. Holders of existing licenses like Tech would not lose high power privs
but
would have to show proof that they had been licensed before changeover day.
(Just keep a copy of the old license as proof). Nobody loses.

Eventually the Novices and Advanceds will disappear through attrition and
upgrading. No hurry, though.

Kim:

As usual, a typically inaccurate and illogical posting. I don't remember
anyone in this NG "swearing" at you, per se. To be sure, you were
called "dumb" in so many words, but when you show up with a call
sign proclaimed by a high FCC enforcement official as capable of
taking the ARS "...one step closer to extinction," what, pray tell,
did you expect? Congratulations on your clever choice of a Vanity
call? Never mind -- I'm sure that's what you *did* expect!

Why waste your time with a lying dipshit, Jim? He knows I've done far
more than he ever did in ham radio. So far what I've done has
brought me zero income. He can't say any such thing, all his digi

geeking has been for pay, despite his lying diatribes. He still hasn't
told us about his (non) exploits on ham radio actually *using*using the
digital modes. I **KNOW** I've done far more actual on the air
with digital modes than he ever did, and he knows it. My first
ham radio computer was a Commodore Vic 20 (all of 20K ram)
and an AIR-1 RTTY interface, well before packet radio came around. And when
it did, the next aquaition was a Commodore 64 (yup, 64K) with the brand new
PK64 multimode interface for packet AND RTTY. Does anyone really believe
he's been on HF with PACTOR or CLOVER???
Well, *I HAVE**!!!!

Meanwhile Kandid Karl has not even been on the air with PSK31, rather has
spent his time slobbering all over his microphone in working DX on SSB.
That's fine by me, but he is much less than candid in his lying
descriptions of my attitude and position merely becasuse I happen to
believe that CW and the testing for it still has a valid place in the
scheme of things. With idiots like him "lading the charge to the future"
there will BE no future.

I'll take Doug Smith 10,000 to one over Squiggy as a leader of
hi tech. Squiggy is a fraud, and a horses ass to boot.

If there's really anyone at FCC who truly understands all this, they
likely understand that eventually the only modes that will work
adequately in ham radio will be digital ones that have enough
noise and interference immunity. That may well take care of most
of the legacy modes.

Why not go one step further and give slices of ALL bands?

The main reason to restrict power is that it reduces the need to test RF
safety/exposure
stuff.
>

>Power limits can be linked to (and justified on) the demonstrated
>level of technical proficiency ...

Only in the realm of RF safety. Does it take more "technical proficiency" to use a 500
watt 2 meter amplifier vs. a 50 watt model? Nope.

> frequency limits are more arbitrary
>and therefore more debatable. (What's the *real* difference between
>7220 and 7230, for example, in terms of the technical competence
>required?)

None. The same is true of power limits, except for RF safety. It's all about where
you set the incentives and what hoops you make folks jump through. Carl loves the "technical proficiency" hoop and the power incentive.

>Why not go one step further and give slices of ALL bands?

It wouldn't bother me at all. Remember, though, that I am a fellow who was given all amateur priveleges for taking the General test. Of course, when I got relicensed in the 70s, I did have to take the Extra to get them back.

>The main reason to restrict power is that it reduces the need to test RF
>safety/exposure
>stuff.

The current rules require that stations who use more PEP to the antenna than the table in the rules need to evaluate their stations. On 40 meters, the limit is 500 W. On 10 meters, the limit is 50 W. Right now, we require Tech and General class operators to answer questions about RF safety.

>>Power limits can be linked to (and justified on) the demonstrated
>>level of technical proficiency ...

>Only in the realm of RF safety. Does it take more "technical proficiency" to
>use a 500 watt 2 meter amplifier vs. a 50 watt model? Nope.

EMC issues are also related to power levels.

>Carl loves the "technical proficiency" hoop and the power incentive.

"Love" may be a bit stronger word. Technical proficiency does satisfy one of the fundamental purposes of the Amateur Radio Service. I agree with you that the power incentive is primarily one of safety and knowledge to use high power responsibly. Of course, that beg the question about what percentage of today's hams of any license class use their linear amplifiers properly wrt the rule to use the minimum power necessary to carry out the desired communication. The old "I desire to be real loud" is pure justification, IMHO. :-)

>The time to develop a plan is now, rather than have the FCC develop one of
>their own and then try to change their minds.

If you want my guess, I think that the FCC would not develop a plan on its own. In the first place, NCI intends to be the first to file the petition for rulemaking after S25.5 is dropped. Although they probably have not set the full policy, as a minimum, that will contain a provision to drop all code tests. The logical step for the FCC would be to issue a Notice of Inquiry, to try to guage the spectrum of opinion on the subject.

And, in the final run, the FCC's determination about what is administratively best for the FCC will probably be a major factor. Any proposal that asks for a complicated licensing structure is, IMHO, doomed to fail.

>of the legacy modes.

Digital radio is not a panacea for interference immunity. While one can gain about 10 dB (+-) over OOK CW in a 500 Hz bandwidth with some modulation methods and encoding, that will not be enough to overcome noise that is 30, 40 or 50 dB above the receiver noise figure. What nice things like FEC really do is to take a somewhat noisy and error-prone signal and make it much less noisy and error prone. But if the signal is very noisy and very error filled, FEC will fail and the signal will still be very noisy and have many errors.

It is kind of like the present-day DSP de-noise algorithms. The can clean up a partially noisy signal, but they do not help if a signal is buried in noise. Of course, as the DSP hardware gets faster, and innovations are made in the software, that will probably improve. This is an excellent opportunity for hams to experiment, but few seem interested.

>prospective hams.

In perspective, in 1963, the ARRL study guide for the Novice was 4 pages. The ARRL study guide for the General was 16 pages. That was all I studied to take my General exam, although as an active ham, I had read articles and parts of the ARRL Handbook at some point.

> Lots of RF safety questions, which of necessity
>crowd out other stuff.

Not necessarily. When the FCC mandated the RF safety questions (originally 5 on the Novice, Tech and General exams), they literally were added. The size of the test increased by 5 questions.

FRS equipment must be FCC Certificated for that use. Amateur equipment is not so authorized. You can, however, modify FRS equipment to operate on the ham bands, if you wish.

>already knows. The Japanese made both mistakes at Midway and it cost them
>their lunch.

Yup. The Germans made the same mistakes.

What it really comes down to is too much faith placed in a particular technology.
The Axis powers figured that their encryption would take so much time to break that any information gathered by the enemy would be "stale" by the time it was obtained. They never imagined the resources that would be used against them.

In at least one case the Bletchley Park codebreakers deciphered an Enigma-encoded message without knowing the decoder settings in advance in less time than Berlin took to decode it with an actual Enigma machine and the correct settings.

--

The big Japanese loss at Midway was not the four carriers or their airplanes, all of which could be replaced quickly at that time in the war. What really hurt
the IJN was the loss of their best pilots and technicians, with their valuable experience. Unlike the USN, the IJN did not rotate front-line personnel like air crews back to training commands.

Sure. That's obvious - just look at what happens in parking lots.

The problems are two:

1) The CUSTOMER has to be convinced that the existing system needs to be
replaced. In
this case, the CUSTOMER is the "average ham" whom you describe in derogatory
terms
quite often. It's those same CUSTOMERS who have to PAY for all of it.

2) There has to be some sort of centralized control that assigns priority to
resource requests.

>> > The distinction between "voice channels"
>> >and "packet channels" (and all the wars that go with that)

I'm gonna give it to ya straight:

That's because those like you who want the changes have NOT made their case.
Instead of doing the show and tell thing, Carl, you lecture and insult people
and
deride their equipment and methods. You also don't give clear explanations of
what you are proposing and why it's better.

Then you wonder why other hams don't jump up and implement your ideas. The
problem is that you don't treat them as CUSTOMERS.

Would you talk to a CUSTOMER the way you have written in this newsgroup?

Look at how all new modes have come to ham radio - SSB replacing AM on HF, FM
replacing
AM on VHF/UHF, SSTV, PSK31, etc. In each case some hams set up their new system
and
then wrote about it, demonstrated it, did the show and tell circuit, and made
it easy to build/use.
They wrote books for the amateur market and conversion/construction articles
for the amateur
press. Eventually the manufacturers caught on and started making equipment.

PSK31 is a classic case. A British guy gets an idea, does the development work,
gets a group
of similarly minded hams in on the project. Has a clear vision and a good
selling pitch. Gives away
the software, too.

The concept becomes reality in a few years, others jump on, ham radio has a great new mode. Then
folks start making specialized low cost kits like the "Warbler". That's how it's done. No mention of
"dinosaur dung" or buggywhips, either.

What function could an extra perform that an advanced couldn't perform?
Whatever it was, I didn't need it. Unlike you, Dick, I don't consider
a piece of paper to be worth much of anything. IMO, the only value in
a ham license is the privileges granted. The only reason I upgraded
is that the advanced class license is now a lame duck.

If 5wpm Morse code dumbs someone down, wouldn't it be better if
that person didn't learn Morse code? If 5wpm Morse code dumbs
someone down, doesn't 20wpm Morse code dumb that person down
four times as much? With friends like you, Morse code doesn't
need any enemies.

When computers moved from command line to GUI operating systems, it was to make things easier for someone to operate, and no one thought of it as dumbing down. When automobiles went from clutch to automatic, it was also to makes things easier to operate, yet still, no one thought of it as being dumbed down. Yet, when ham radio tries to move forward, the opposite is the norm.

UHF stops at 3GHz. To correct your statement would be:
"Last I checked, techs now only have VHF/UHF/EHF privileges."
Your statement left out 27GHz of spectrum. :-)

Absolutely, way too much power for entry level.

Well, a couple of points...

When you say voice. The FCC doesn't define voice. Voice is audio frequencies
only... ;-)
Did you mean phone and if so that implies omitting image. Did you mean that.

When you say data/cw you are omitting RTTY. Did you mean that?

When you say 100 watts I think you should up that to 150 because there are
plenty of radios that do 100 watts easy and the newbies should not have to
worry about running up to the limit all the time. We don't need to set up an
obsticle course... ;-)

> Just my personal view at this time. I am sure that my views will evolve
as we
> get closer to the point where the FCC has to consider what to do.

That's fair, but I guess I'm saying, if you start limiting certain modes,
you should try to do so with real reasons in mind not just do so

arbitrarily. After all, as it is now, Technician Plus has CW on four HF bands but they cannot use the phone mode "MCW .. for providing telegraphy practice interspersed with speech". WHAT'S UP WITH THAT!!! ;-)

I'm willing to bet that was arrived at because of some compromise and no one was paying attention. They certainly weren't 'looking out' for the Novice or Technician Plus operators interests.

> What do you think? I think it's fascinating.

Well, I think it's kind of depressing, and I'm constantly resisting the urge to lash out more vehemently. I cancel a lot of newsgroup messages that I have written. I try to employ some degree of maturity, because no matter what somebody might say to me, everything I write reflects entirely on me rather than on the person I'm writing to. The people on the newsgroup are quite adept at picking out flaws in an argument, and so I try to write in anticipation of known counterarguments. Being unreasonable and beligerent usually gives people the greatest amount (or best quality) of ammo to use against you. But still, I can't always resist the opportunity to fling a good stinger now and then when a prime opportunity presents itself. ;-)

Right. Due largely to the fact that WE AREN'T CONDUCTING BUSINESS on the ham bands. We're not selling something, promoting something, connecting to an enormous database, or user base for that matter. It's not what amateur radio is about, and to compare it with the business world is myopically, over-simplistically ignorant.

That's kinda misleading, Ed. The ARRL did not sell "study guides" in 1963.

What the did sell was the License Manual for 50 cents. In that manual the
study questions for the Novice and General took up the space you describe.

In addition, the LMs contained all of the then-current regs for the ARS.
These needed to be studied as well because the study questions did not
cover much of the regs.

The old LMs simply reprinted the FCC's study questions, btw. Not only were
the questions not the same as on the real exam, but the study questions
were in essay form, not multiple choice.

> That was all I studied to take
> my General exam, although as an active ham, I had read articles and parts of
> the ARRL Handbook at some point.
>
Which means you had more information than was contained in an LM. An ARRL
Handbook of that era cost $3.50.

> > Lots of RF safety questions, which of necessity
> >crowd out other stuff.
>
> Not necessarily. When the FCC mandated the RF safety questions (originally 5 on

Those were the OLD tests. Under those rules a new Tech had to take two
writtens totalling 65 questions (as I recall). Currently a new Tech requires
only a single 35 question test.

I don't think I made that claim. The point you weren't able to derive from the analogy is that one's technological level is not necessarily defined by or limited to the age of the technology one employs on a daily basis. The logic you use to arrive at your "50 years behind" assessment of amateur radio is flawed. You are an amateur radio operator, and you aren't 50 years behind. You stand as an exception to your own rule. Most technologies are defined by their leading edge, Carl. Why do you make an exception for amateur radio? The only reason I can think of is that you're a sourpuss.

> As far as the rest of this debate, I'm not going to play word

Word games that prove your logic is faulty. Yes, I don't blame you for not wanting to play. Please do continue to talk substantive techinical issues. Many times, the details are interesting. Other times I can't keep my eyes from glazing over. But when your "techincal issues" vere over to pointless derision of amateur radio, I reserve the option of debating your terms with you.

Don't get me wrong, Cecil...I am glad you upgraded. However that last paragraph made absolutely NO sense.

WHAT priviledge do you have/use now that you didn't before the upgrade?

If you DO use the priviledges, then it is apparent the paper DOES make the difference, for without it, you'd NOT be using the priviledges.

If you DON'T use the extra (pardopn the pun) priviledges, then your "lame duck" Advanced Class license wasn't so lame afterall, now was it?

As a matter of fact, you had the distinct honor of having something no one else would ever be able to earn....AND...Everyone would KNOW, beyond a shadow of a doubt that you DID pass a code test "back when". Present day Extra's and Generals cannot make that claim.

Why the hell not? An illogical assertion can logically be countered by the
same.

Let's put this into perspective, twist. We were talking
> about illegal operators, people that have no respect for the law,
> other operators, or people's lives.

No we're not asshole, we're talking about EMI (Elecrto Magnetic
Interference) and possible origins. You alledge it to be CB Radio and we can
alledge it to be Ham Operators. No proof of either has been shown!

Or didn't you read those
> references I cited just a couple posts ago?

Sure I did. Not a single fucking word of it said CB Radio in it anywhere!

My wife's subspecialty of power engineering is industrial lighting,
and she avers that there have been tremendous advances in lighting
technology and controls in the last decade or two.

In the residential arena, look at high-intensity halogen-excited
lights and the mini-compact low-consumption fluorescent bulbs which
are replacing Thomas the Tinkerer's 100-year old filament-in-a-vacuum
bulbs.

>information on the box?

I never said "at the same time." However, what I did say is correct in that I would assume that some part of its RF energy, given enough time, would fall on EVERY frequency in the band in the absence of information to the contrary, just because it is identified as SS. The problem is once it indicates that even one of these frequency slices is outside of the amateur allocation and there is no information that indicates that it could be contained completely inside the allocation, it becomes identified as an unsuitable device for amateur use that exceeds the part 15 limits.

So, if it lists a range where part of that range is outside the amateur allocation and says nothing more, one must assume that it is unsuitable without evidence to the contrary, at least in its stock condition. Of course, this leads to the question of modification possibility, but now, one is getting into the secondary source information, etc....

So, for this wireless lan stuff, if it says 2400-2483.5 and DOESN'T say anything about channels or subranges, an amateur, assuming intent to use in excess of part 15 allowances and going by the box information, is going to pass that item up and select one that DOES say that it can be limited.

The last time I looked (not recently - over a year ago), none of the devices I found mentioned channels or subranges.

I don't use the extra privileges. Do you know what a "lame duck" is? I don't want to be caught in a position where advanced's are forced to upgrade to extra or be demoted back to general when the FCC decides to eliminate the advanced class altogether.

The EPA is already trying to ban the use of flourescent bulbs because of the miniscule amount mercury that is contained in them. Where I work, we were informed that we simply can't throw flourescent tubes in the trash anymore. They have to be discarded according to EPA regulations. The same goes for high-intensity discharge and sodium vapor lamps used in our warehouses and process facilities. Of course, this is just for industry, but don't be surprised if it's soon applied to everyone.

The only thing that he's contradicting is your lack of understanding.

The original 802.11 DSSS PHY and the 802.11b PHY have the same
channels, as Dennis said ... and virtually the same spectrum mask.
As Dennis said, 802.11b just uses a more exotic modulation/coding
scheme to pack 11 Mbps into the same RF channel size.

> >both have the same channels, 802.11b just adds a more exotic modulation.

Yes, if you don't even understand the basics and aren't willing to
read 50 pages to attempt to understand, you have no business
trying to adapt the device for use in the Amateur Radio Service.

Have you sought out a tutorial book on SS as I suggested?
(Or do you just want to bitch and troll for responses on how
"packaging is inadequate" ???)

From what I see, the tests have never been meant as comprehensive exams on everything one needs to know to be a ham. Rather they are a mixed bag of stuff meant to meet several goals:

A - Address specific problem areas in the ARS. For example, back when hams' straying outside the bands was more common than today, the tests were full of questions about frequency meters, xtal tolerances and band edges.

B - Insuring the safety of the general public. That's why the RF exposure questions were added, and why there are questions aout house wiring and grounding.

C - Expose amateurs to current radio techniques and technology. Examples are the questions on spread spectrum.

D - Insure some knowledge of the regs

>
>the test seems to cover the physical layer and wire-level protocols of
>communication, so to speak, but doesn't really cover much in the way of
>actual communications protocol.

They figure that most hams will pick up most of it on the fly. Their main concern
is proper ID and interference mitigation.

I think it's one of the points of modern amateur radio, but not the only one.

> or has the art
>advanced as far as it can by amateur means?

That depends what is meant by "advancing the art". Obviously very few big revolutions in technology will come from the basement workshops of hams. But what does come from those shops are ways of doing things more simply, less expensively, and/or with adapted technology.

For example, I was on RTTY back in my college days when ham RTTY meant 60 wpm Baudot, usually using machines like the Model 19 teleprinter and a big heavy expensive homemade TU (TT/L-2, as I recall). Today we have PSK31 which requires a PC with soundcard, some cables and some free software. And no oil smell, messy ribbons, noise or rolls of paper (sigh).

Did PSK31 advance the state of the art? I think so.

>[1] ex-KC6PVE, now KD7PNB.

5 wpm to get an EXTRA. Believe it.

>[3] c. 1994 general pool

Hasn't changed that much. You can download the entire current Q&A pools from various websites. You can also take practice tests online. They are just like the real thing only they don't count, of course.

>[4] I have a sick heath HW-101 I've been lugging around since 1992,

Which means that you claimed experts did not explain it clearly. I noted carefully that when you guys referred only to the 20Mhz channel spacing, you also referred only to the .11b spec, but clearly also avoided the original .11 spec.

Nor have I tried, because prior to this, such a device was considered unsuitable for use in the service. If I choose to, I will do the research, but first I have to know that the device is in fact suitable (which is what I

learned via this thread). What you seem to miss is what I originally said: On its surface, the device will be considered unsuitable before one even goes further to inquire because there is nothing that leads the average person (the non-engineer, who doesn't memorize obscure standards) to believe that it could even be modifiable without a PhD in electrical engineering, considering that most electronics are complex LSI.

To Carl: As both a manufacturer and an amateur, shouldn't you be pushing the information that it is suitable more so than you have in this discussion (like on your company's products)?

This all started as: You said it could go there; I heard it couldn't. You showed why? I now accept your explanation, although incoherent. I note that someone else recently indicated that they heard it can't. This tells me that you have to do more to get the word out.

>Have you sought out a tutorial book on SS as I suggested?
>(Or do you just want to bitch and troll for responses on how
>"packaging is inadequate" ???)

I don't need a tutorial. However, when I learned about SS, only the frequency hopping kind had been in use - direct sequence hadn't entered the picture yet. However, I don't really care how it does it at this point.

Boy Frank has gone out on
a limb on this one. Do I understand the quote right?
He's saying that illegal cb brought down a Blackhawk
helicopter? I must have missed that one on CNN, you
would think it would've made Headline news too.

So Mr Superior, go ahead and enumerate those benefits. Keep in
mind that ham radio is a totally voluntary avocation in which all
participants engage in pursuits of interest to them personally, with
no renumeration and entirely at their own expense. You are further
reminded that there is almost never any reason whatever for hams to
utilize high-rate data throughput nor for extreme efficiency where weak
signals must be extracted from far below the noise floor.
Most of the modes and methods you describe are in the realm of the
experimental, and unless you're been to selfabsorbed to notice, there is a
LOT of that going on by lots of hams.

And yet Carl Stevenson, like most of us, still uses Tom the Tinker's
ancient invention... :-)

Just to "make things easier"... Right. So who said things are better when they
are simply easier?

Looks like you have leaped onto Carll Stevenson's bandwagon, complete with all
it's flat notes and equally flat tires.

How you can say few seem interested if beyond reality. What few here are
interested in is the continuous selfindulgant puffery offered by Stevenson and his
few minions. Those of us who love this hobby do what we do because we want to do
it. I "experiment" with new technologies. No, I don't invent them, I don't write
software, and don't plan to attempt to learn how at this stage of life. If I was
somewhat younger, I'm rather sure I'd have a different viewpoint, but that sure
doesn't mean I'm uninterested in experimenting with new technologies, nor that I in
any way reject their introduction to ham radio, as Stevenson insists. He simply
lies, or is too dense to recognize facts.
I hereby state that I am certain beyond doubt that I have operated, on the air on
HF ham radio, far more time with new technologies that he has or likely ever will.
The man is a blowhard, pure and simple.

3140. NO-CODE: THE END-GAME

Newsgroup: rec.radio.amateur.policy
Date: 2002-02-01 08:30:31 UTC

*
NO-CODE INTERNATIONAL
Candidates statement, and
CALL FOR ADDITIONAL CANDIDATES.

Please pass this message on to other Radio Amateurs, especially NCI members.

NO-CODE: THE END-GAME

You may know me: I'm Bruce Perens K6BP. I'm the founder of No-Code International. Outside of Amateur Radio, I'm probably best known as one of the founders of the Open Source movement in computer software, and an early Linux developer. You can read my bio at http://perens.com/ .

When I started NCI in 1997, I never dreamed that we'd achieve our goals so quickly - but we are most of the way there. Last year, the International Amateur Radio Union, composed of national radio societies from all over the world, voted to ask for the removal of the international treaty provision requiring Morse Code testing for Radio Amateurs. Even ARRL voted in favor of removing code requirements from the (international) Radio Regulations. There is no remaining credible opposition to NCI's cause on the international level. It's certain that code requirements will be removed during a future World Radio Conference, hopefully the one in 2003.

The battle then moves on to the national front, or should I say 204 national fronts. But this might not be much of a fight. National Amateur Radio societies that lobbied to preserve code testing would likely be opposed by their own governments and citizens. The U.S. FCC has already stated that their only reason for 5 WPM code testing is to satisfy the international treaty requirement. As its demographics change, the worldwide Amateur population becomes progressively less enamored of code requirements. Even pro-code organizations like FISTS have wisely concentrated on promoting the use of Morse on the air, rather than on the test. Thus, I don't see it as a winning strategy for any radio society, even ARRL, to continue to drag its feet on code testing once the international requirement ends. We won't fall asleep at the switch: NCI will persevere until the day that code requirements have been eliminated in every nation. But the end-game calls for a very different NCI from the one we've had up to now.

NCI has always been an adversary, and now it's time for us to be a partner. Our opposition has conceded enough that it's time for NCI to reconcile with them. If we don't do so, we could snatch defeat from the jaws of victory by motivating new opposition in the no-code battle. But I am not confident that some of the present NCI directors are ready for the challenge of cooperation with their old enemies. A number of them

cling to a rabid and vindictive ARRL-phobia in a time when little more than watchfulness is appropriate. Thus, I am calling for the formation of a slate of candidates to bring NCI into the future, as a partner in the rehabilitation of Amateur Radio.

The CW requirements battle, carried on since the 1950's, has been a crippling one for Amateur Radio. In a time when we should have been moving the Amateur Service into the future, many of us dug our heels in to the past, diverting our collective energy from the healthy growth of our service and the defense of our radio spectrum allocation. We Radio Amateurs, through our own short-sightedness, took a vital Service and transformed it into technology's endangered species. But the Amateur Radio Service remains critically important as an educational tool. Amateur Radio is still the only practical means of maintaining a worldwide corps sufficient to improvise effective communications in any emergency, no matter how large. The social benefits of the Amateur Service, and the many good attributes of the Amateur Radio hobby, must be preserved. All Amateurs must unite to achieve that goal.

For NCI to take its appropriate role in the end-game of the no-code battle means cooperation with national societies like ARRL, and with IARU on the international front. Although I was bitterly opposed to ARRL's long-standing policy in favor of high-speed code testing, my goal has always been to get them to change their minds, not to defeat them. I've maintained my ARRL membership during the entire existence of NCI, and was lucky enough to be able to donate $1000 to ARRL's frequency defense fund last year. Every U.S. Amateur should donate whatever they can to that fund - go to https://www.arrl.org/forms/fdefense/fdefense.html to do so, or read about the fund at http://www.arrl.org/news/features/2002/01/14/2?nc=1

It's time to re-build NCI's leadership. Any person who was an NCI member on December 31, 2001 can be a candidate for director, and can vote in the election to be held no later than April 30. NCI directors can volunteer to attend government and radio society meetings on behalf of the organization, but most of them do little more than discuss the organization's policy and vote their directions via email. Thus, the load of being an NCI director is a manageable one for a busy person. We need new blood, and we need to question our existing leadership about how they will bring our organization into the future, if they are to continue in their positions at all.

Please write to me and tell me how you feel about this, especially if you are willing to serve as a candidate.

Many Thanks

Bruce Perens K6BP
Incumbent NCI Director

___king Idiot:

His point was that if you modify an FRS radio for use on the amateur
UHF band, it is no longer legal to use that unit on FRS, since the
modification violates they type acceptance requirements. Are you
always this ___king stupid?

From: bruce@perens.com (Bruce Perens)

>Even ARRL voted
>in favor of removing code requirements from the (international) Radio
>Regulations.

A minor clarification; ARRL voted not to oppose removing code requirements from the international radio regulations.

> A number of <the present NCI Directors> cling to a rabid and
> vindictive ARRL-phobia in a time when little more
>than watchfulness is appropriate.

I do not know all of the NCI Board family, Bruce, but most of the ones I have spoken with here have, as a result of a sometimes-arduous dialogue, developed a balanced view, not a rabid and vindictive view, of ARRL and its policies (and potential policies).

I would suggest, however, that those that would like to influence or change ARRL's policies in this, or any, area, not adopt "watchfulness" as a strategy. The ARRL Board has a standing interest in hearing the views of its members, and potential members. I have done so, on numerous occasions. Tom Frenaye once told me that I am but one of a handful of members that regularly sends him opinion and thought. Like any Board, ARRL's has a wide range of personal opinion amongst its ranks. Even those that might feel that Morse code testing should be eliminated are not insensitive to the fact that membership views are central to their support of ARRL.

Those on both sides of opinion on this should make their views known to their ARRL Division Directors. See:

http://www.arrl.org/divisions

>NCI has always been an adversary, and now it's time for us to be a
>partner.

That has worked well for me in RFI damage control. ARRL never would have been able to help the Home Phone Networking Alliance, HomePlug and the VDSL committees include notches in the HF ham bands if it had taken an adversarial stance.

In my discussions here with many here, including some of NCI's leadership (personal opinion on both sides), I have always made the point that adversity is not necessary, or even helpful. Some have agreed; others have not.

>Our opposition has conceded enough that it's time for NCI to
>reconcile with them.

It will be interesting to see what that reconciliation is. :-) The reason that I have never joined NCI, in spite of being a mostly no-code-test advocate, is that there has been no room for compromise in its position. I believe that such compromise is important to amateur radio, especially to our once-famous sense of community.
Just as a couple of examples, having some questions in the written exam on the text of a few minutes of sent Morse code, wrapped into the overall score, would be a reasonable thing to have. After all, testing or no, Morse code continues to be a viable and important part of amateur radio. I could also see cause to have even a pass/fail Morse code test, giving only access to the lower 25 kHz of 80, 40, 20, 15 and 10 meters. After all, by useage, that part of the band is 99% Morse code, so those not interested in the mode would not mind that much at all, but it would make a big difference to those that want to see some Morse code testing in amateur radio.

Just a few personal thoughts on this post, Bruce. Thank you for making it.

Can you give me some pointers to those doing such experiments in the modes and methods? I know of some, but I do not know of the "lots" that you are telling us about.

From: "Kuay Lin" KL@junoperelec.org

>> Which of course nullifies its acceptability status for FRS.

> And your point is?

It was an important point, Kuay. Phil wanted to make sure that those that modified equipment for use in the amateur bands knew that in doing so, they could no longer use the equipment in its original use.

I can modify a CB radio to transmit on 10 meters, but I can then no longer use it to transmit on CB. I can modify a car for off road use, but some of those modifications are such that it is no longer legal to use it on the road.

Why did you ask him what his point is? The point of his post was really pretty clear.

A few hams don't seem to know that the ARS has any content restrictions ;-)

--

Serious question:

Why would hams want to encrypt anything they transmit? I can understand the encryption of control links to avoid unauthorized access. Some emergency messages might be better sent by means other than unencrypted voice. But these are the rare exceptions.

Why would hams want normal everyday stuff encrypted?

Halogens are an improvement on the basic incandescent, but are still the same basic idea.

Compact flourescents are much more efficient but have some characterisitics that limit their use.

The basic garden-variety incandescent is about 125 year-old technology. The originals were carbon filament. The inert gas filled tungsten filament versions

have been around for almost 100 years. Yet they are still very widely used.

Old does not been bad, despite what some would foist upon us.

Thats great. There are some groups here in Michigan that would impress ya alot, and there are some that are like I described in the earlier post. Kent County, MI (KCEST) is one prime example (of many) of where we would like our group to migrate to.

Nope. They just seem to go hand in hand it seems at least. Not pulling everyone under that particular blanket, but an overwhelming majority seem to be. I have packed away my Shortwave reciever. Not enthused about it anymore. Time right now is a huge factor for me. If I have that much time that I can sit and listen to any radio, I should be doing something else, like work or studying for my educational pursuits.

I havent coverted anyone. The closest thing to that was encouraging some people (prior to licensing) to consider at least pursuing the entry level technicians license, and if it interested them further, to go further which by procedure requires morse code. 2 of them did, and 1 didn't.

I guess I am so sick and tired of the bitching, whining and moaning and not seeing the lack of positivity and support within our hobby, I guess I am becoming just like what I am complaining about right here. I guess if I am gonna get "slammed" at every turn, I am gonna give it right back, instead of "taking it" like a wuss..... And some times it is just "venting".

Are you disagreeing with me that this is an opportunity to experiment or do you disagree with me that few seem interested in doing such experiments? When you criticize a sentence that has two points to it, it is helpful if you identify which of those points you disagree with.

>Did PSK31 advance the state of the art? I think so.

Within the amateur service, I agree, although there is nothing new about PSK as a modulation method. The advance in the amateur service was in creating the varicode used to encode text, although even this is a variation on Morse code, which uses a similar variable-length encoding. I don't know for how many years it has been permissible for amateurs to use a publicized unspecified digital code, but it is nice to see it finally taking off.

How many other such advances in the state of the art can we find from the past 10 years? What is their applicability to advancing the state of the art outside of amateur radio?

Here are some numbers to think about. These are the number of unexpired
FCC ARS licenses held by individuals on the dates listed:

As of May 14, 2000:

Novice - 49,329
Tech - 205,394
Tech Plus - 128,860
General - 112,677
Advanced - 99,782
Extra - 78,750
Total - 674,792

As of January 31, 2002:

Novice - 40,009 (decrease of 9,320)
Tech - 235,351 (increase of 29,957)
Tech Plus - 84,180 (decrease of 44,680)
General - 138,784 (increase of 26,107)
Advanced - 86,422 (decrease of 13,360)
Extra - 98,382 (increase of 19,592)
Total - 683,128 (increase of 8,336)

Few seem interested....hmmm. I invested in a few hundred dollars in DSP books a few years ago. I also have some of the TI DSP data books. I can't even read the stuff, Ed. Do you honestly think a lack of interest is the primary factor hindering DSP innovation in amateur radio?

Thanks for the nuance. As an organization attempting to transition its
own membership, I understand the reasons for ARRL's careful stance on
Morse requirements, especially why they aren't saying much about what
they will do after the international regulations change - it would
only inflame the membership without doing any other good.

> I do not know all of the NCI Board family, Bruce, but most of the ones I have

I think you are mostly dealing with Carl, who has tempered himself
well after starting out some years before as a more inflamatory sort.

Behind closed doors, what I hear from at least two of the other folks
is really rather nasty, and should not continue. So, it's election
time.

Thanks

Bruce

>When I started NCI in 1997, I never dreamed that we'd achieve our goals so
>quickly - but we are most of the way there.

Most of the road had already been traveled. We've had code waivers since 1990 and
a ham license without a code test since 1991. FCC had been trying to push a nocodetest
ham license since 1975.

>Last year, the International
>Amateur Radio Union, composed of national radio societies from all
>over the world, voted to ask for the removal of the international treaty
>provision requiring Morse Code testing for Radio Amateurs.

That's no surprise.

> Even ARRL voted

Why must it be a "fight", Bruce? Why use the words of violence? If it's
the "end game", why talk as if you want to kill off those who disagree with
you?

> National
>Amateur Radio societies that lobbied to preserve code testing would
>likely be opposed by their own governments and citizens.

Not really. The national societies have been moving away from support for
code tests for years.

>The U.S. FCC
>has already stated that their only reason for 5 WPM code testing is to
>satisfy the international treaty requirement.

They said essentially the same thing a decade ago.

>As its demographics change,
>the worldwide Amateur population becomes progressively less enamored of
>code requirements.

You mean as in TESTS?

>Even pro-code organizations like FISTS have wisely
>concentrated on promoting the use of Morse on the air, rather than
>on the test.

FISTS has ALWAYS been a group that promoted the USE and avoided any
stance on the TEST.

>Thus, I don't see it as a winning strategy for any radio
>society, even ARRL, to continue to drag its feet on code testing once the
>international requirement ends.

Even if that's what the membership wants? That's why the ARRL has kept its
stance for so long. Directors who ran on anti-code-test planks LOST.

The latest policy change came about because the ARRL BoD realized that
there was no point in supporting S25.5 when the other national societies were
against it.

>We won't fall asleep at the switch: NCI
>will persevere until the day that code requirements have been eliminated in

>to the past, diverting our collective energy from the healthy growth of
>our service and the defense of our radio spectrum allocation. We Radio
>Amateurs, through our own short-sightedness, took a vital Service and
>transformed it into technology's endangered species.

How, exactly?

The USA has had a nocodetest license since 1991. Eleven years. Has there
been a technologica revolution in the ARS because of it? Nope. Has there
been more growth than in the 1980s? Nope.

> But the Amateur
>Radio Service remains critically important as an educational tool. Amateur

>Amateurs must unite to achieve that goal.

At last, something I can agree with.

--

It's pretty clear that FCC will drop Element ! like a hot potato as soon as
S25.5 permits.
They won't even need a petition or proposal because their statements in the R&O
for
98-143 make it clear that they want code testing to end. FCC would have
eliminated
all code testing in April of 2000 (if not before) except for S25.5.

So what is NCI's and Bruce Perens' vision of US amateur licensing after Element
1
is removed or waived? Will NCI even be needed after all code testing is gone?

gee whiz, what does a ham have to do to get some credit for doing a good thing? Seems like you want to minimize the contribution of PSK31.

Heck, Hedy Lamarr coinvented spread spectrum more than 50 years ago. It's OLD. Does it have dinosaur $%^& all over it yet?

>I don't know for how many
>years

Raising the bar there a bit, aren't you Ed? Not only are amateurs expected to advance the state of the art in amateur radio, but also outside of amateur radio.
Well, in fact amateurs probably do advance the state of the art outside of amateur radio. We all work for a living, don't we? Some of us work in technical fields and develop non-radio related technology.

Just out of curiosity, what do you hope will be accomplished by engaging in this type of rhetoric? It's already a not-for-profit passtime. Are you trying to make it thankless as well?

> quickly - but we are most of the way there.

Hello Bruce,

Speaking as a relative newbie and coming into amateur radio with a
pretty unbiased stance re. code vs. no-code, I'm not sure if the words
"achieve" and "goals" quite fit wrt what NCI has done. I was fortunate
enough to have had several "long distance" Elmers who conveyed the
meaning of setting a goal and enjoying the feeling of accomplishment
as a result of achieving that goal. I know some might argue that the
code itself is not the issue, but rather the requirement of having to
demonstrate a level of proficiency for HF access that's at hand. I
submit that if that were truly the case, there'd be no issue. I for
one never felt as if there was a threat to the mode of CW and
certainly never fely any resentment for having to "earn" HF
privileges. On the contrary, I feel a sense of "accomplishment" for
not only the physical/mental excercise of learning Morse, but also for
the sense of "achievement" that "came along for the ride." Like I
said, if you look at it from a relatively unbiased position with a set
of "fresh" eyes, I think what NCI stands for is anything but
"achievement."

> Last year, the International
> Amateur Radio Union, composed of national radio societies from all
> over the world, voted to ask for the removal of the international treaty
> provision requiring Morse Code testing for Radio Amateurs. Even ARRL voted
> in favor of removing code requirements from the (international) Radio
> Regulations.

This is not entirely accurate. "No comment" does NOT equal an
endorsement.

> There is no remaining credible opposition to NCI's cause
> on the international level. It's certain that code requirements will be
> removed during a future World Radio Conference, hopefully the one in 2003.

It's too bad that an internet based (With mail-in ballots too.) vote
encompassing all US licensed amateurs re. this is not fiscally viable.
(Yes, I made inquiries to the league.) I'd venture that your statement
above would prove inaccurate.

> NCI has always been an adversary

Is this not a telling statement, in and of itself.

> Our opposition has conceded enough that it's time for NCI to
> reconcile with them.

It's sad that you appear to be referring to the majority of amateur radio operators as your "opposition." If the FCC stated that the reason they require code testing is because of the ITU requirement, who does that leave..."we the people?"

> If we don't do so, we could snatch defeat from the
> jaws of victory by motivating new opposition in the no-code battle.

It's very fitting that you take responsibilty for "igniting new opposition to the no-code battle." "Motivating?"...no, I don't think so. Elmers motivate. To fight such an arduous "battle" to remove a perceived "barrier" in such a underwhelming "rite of passage" smacks of underachievement.

> Please write to me and tell me how you feel about this, especially if
> you are willing to serve as a candidate.

Well, please consider this as written notice of one newbie's feelings. Yes, I'm willing to serve as a candidate...on any organization that will fight to preserve amateur radio's rich tradition. In my opinion, NCI's "goal" was already satisfied at it's inception. There is a no-code ticket. Everybody'd like to enjoy the pleasures of the local country club, but nobody want to put in the required work to earn the resources to afford it. It's be kinda amusing if it weren't so sad.

It was originally ported to a DSP eval board, if I remember correctly.
It's popularity snowballed when it was ported to the PC platform.

I never expended any work in getting my ham licenses. I don't
see the necessity of work being performed as a requirement
in Part 97.

Is it the 11mtr band you mean, around the 27.555MHz usb.
these people have been using these frequencies for years, and no-one is going to stop them. most r-hams including myself started of on 27.555, this led to many of us becoming a r-ham.
have you got nothing better to do.

Ed, my own personal concern is that there are way too many folk being exposed to the idea that hams can modify equipment and use it legally anywhere (other than the ham bands). There have been a lot of flames in rec.radio.cb, but to the unitinitiated it appears that a whole lot of modification is either legal or will 'enhance' the operation of their equipment. Increasing the deviation in an FM transmitter does, of course, something other than make it 'loud'. It has been mentioned in posts on other boards that you 'can't overmodulate an amp on SSB'. Of course, overdriving an amp has its' own problems. Thanks for pointing out that there was in important point to the post. It certainly, in my opinion, was not meant to flame anyone.

Agreed. 10 years ago when I became a ham, 10 meters wasn't as
cluttered with lids who don't know the meaning of "operating split"
when it comes to chasing DX. As an ARRL member, I think it was a
shame the ARRL took the stance on the license restructuring. I've
seen posts on the DX Packetclusters from foreign stations saying "Boy
I bet the ARRL really must be proud of themselves". 10 meters used to
be a really fun band to be on, it still can be, but with lids who
don't know simple procedures and operating practices, radio
manufacturers might as well toss the license paperwork in the box
along with the rig. All in all, the ARRL is a good organization, but
any organization will make mistakes, big or small.

I don't think advancing the state of the art necessarily equates to developing new fundamental principles. "State of the art" refers to the technology that's in actual use, not the bleeding edge. The way amateurs have historically contributed to the state of the art is at the application end, devising techniques and designs to better use the existing technology. PSK31 is a good example of that.

> How many other such advances in the state of the art can we find from
> the past 10 years? What is their applicability to advancing the state
> of the art outside of amateur radio?

If you're looking for wholesale transfer of amateur technology to the commercial field, you can find a bit. E.g., http://www.marinenet.net/Radio%20Modems.htm

But most of the crossovers between Amateur Radio and the commercial world are probablty from individual hams who are also employed in the industry. For example, suppose a ham who devised a clever means to reduce the power consumption of his homebrew QRP transceiver reused the technique in his work. You would never know it happened, much less be able to document it. That doesn't mean such things don't happen, though. And I'd say that has always been the principal way hams have contributed to the state of the art.

When the FCC says, "continuation and extension of the amateur's proven ability to contribute to the advancement of the radio art," do you really think they don't mean the radio art in general, not just its application within the ARS? If so, why did they use the broad term "radio art"? Why didn't they just say "continuation and extension of the amateur's proven ability to contribute to the advancement of his own art"?

I'm not sure if "r-ham" means "licensed radio amateur" but if it does, no, most hams DID NOT start on 27.555. A few old-timers maybe.... that used to be a ham band.

And thanks to you for adding that not every modification made to radio equipment will necessarily be legal or good operating practice if used within the Amateur Radio Service. Hams are permitted to do such mods because they have demonstrated some competence about the effect of those mods and the applicable rules within the service.

>only inflame the membership without doing any other good.

I am not at all sure this is accurate, Bruce. They are not saying what they will do after the international regulations change because they have not reached a decision about what they intend to do. I think that for ARRL, any such decision would be premature. The ARRL Board has not made any decision to "transition" its membership. .

Let's assume that WRC-2003 makes a change to the international requirement. It will not be an official change until the treaty is ratified. How much time will that take? From there, although NCI will almost certainly be among the first to petition the FCC for a rules change, it is likely that this will be a longer than usual process. This could all be at least 3 or more years away. Do you think that the overall membership of ARRL right now till be the same as it will be 3 years from now? Do you think the views of those members will be the same as they are today? I do not. Also, in that time frame, there could well be changes in the membership of the ARRL Board of Directors. I think that an ARRL Board that made a decision now that would appear to be binding to a future Board will not be making an appropriate choice.

I gave this a bit of thought on my drive home today. If you were serious about an NCI/opponent compromise, what could that compromise be? I am just curious? I am having trouble envisioning what sort of code testing NCI could support to reach a compromise with those that feel code testing should remain an important part of testing.

When it comes to ARRL, I believe that your statement that NCI seeks to persuade ARRL and others groups to have a position in line with NCI goals is the best course of organization an organization could take in this area. (This includes those organizations, or indidividuals, whose views are to keep code testing.) Some of the things I have seen some of NCI's leadership say, IMHO, very much get in the way of that goal.

At this point, I do not see that the ARRL Board has made any decision, other than its decision not to expend ARRL resources trying to oppose any reduction or elimination of code testing at the international level. If this gives them more resources to try to deal with the 40 meter issues, I am all for it. If there was a strong feeling among the ARRL Board members that now was the time to reach a decision, they would have hammered one out. If there was a strong feeling on the Board that everyone is certain what ARRL should do at this time,

they would have done it. Clearly, the Board wants to see just what changes are on the plate before it decides what to do and equally clearly, IMHO, they want to learn more about what ARRL members want and how, or if, those wants will be different when the decision needs to be made than they might be right now.

>Behind closed doors, what I hear from at least two of the other folks
>is really rather nasty, and should not continue. So, it's election
>time.

What is said behind closed doors is probably a valuable function of any Board. What counts, IMHO, is what is said in front of those doors. From my conversations here, some of the NCI Board see appear to see ARRL as the sworn enemy, others see ARRL in a more balanced light. I personally lean toward the latter.

Speaking of personally, when I offer my speculation about the ARRL Board, I am not speaking with any inside knowledge about what they intend to do, other than my knowing some of the Board on a personal level and knowing the standing interest the Board has in hearing from its members. Just to put that into perspective.

Good luck in your election.

>I bet that guy from CQ isn't a big fan of the ARRL. Is the other guy named
>Larry?

ARRL has a very friendly relationship with CQ magazine. Rich Moseson served as an ARRL Section Manager while he was a CQ employee. He has also served on a few ARRL committees, making positive contributions to the work he is involved in.

CQ is a magazine; ARRL is a membership services organization. I do not see any conflict. If someone on CQ staff contacted me for technical help on an article, or one of their authors did, I would gladly extend them help. In fact, I have done so, with W5YI when he wrote some of the CQ material on RF safety a few years ago, just to wrap it all together. Fred, too, is an ARRL member and I will offer him technical help to the work he does for Amateur Radio.

>How, exactly? Give us some PROOF, for once.

In one form or another, we have had code testing since day 1 in Amateur Radio. Hey, wasn't the first code test at 5 wpm? :-) Over all of these years Amateur Radio has supposedly been crippled, it has grown and flourished. The only "leading indicator" is that the growth picked up with the no-code tests and appears to be picking up with the 5 wpm change.

In my personal opinion, though I have one on code testing, it is not that big of a deal one way or the other. It is a major leap to go from a belief that it is time to replace Morse testing with something else to it is "crippling Amateur Radio."

>Yeah. But then again, it doesn't say anything about force either. ;-)

It is all a question of accomplishments and the ham who had to work real hard to meet the requirements is not given more priveleges than the ham who easily met those same requirements.

Amateur Radio exists to meet the needs of the public interest and our regulators will determine what rules facilitate it meeting those needs. If they feel that the public interest requires an Amateur Radio Service with Morse code skills, they will continue to test them.

>more of the same lousy
>language and operating going on down on the REAL CB band

Hi Gary,

Your statement is quite accurate. What you'll find on the so called "freeband" is very different than the truckers who buy cheap "export" 10/11-meter rigs at the local truckstop. Yeah, there IS an 11-meter "hobby" band but the serious folks are indeed migrating to amateur radio. You'll very rarely, if ever, find these folks bootlegging on 10-meters. The trucker, however, has no problem with parking on that "clear channel" he found on ch. 19 "two-up." I'm certainly not defending either, both are operating illegally. I'm merely pointing out the difference...and yes, one adapts quite well to ham radio while the other has no interest in hobby radio.

>*I personally* don't think we want OR
>need them as hams... MORE isn't always "better"...

Quite true. Take it easy. :-)

Try reverse engineering. If you had to decode CW using DSP techniques,
how would you do it? Hint: Sample at double the Morse code audio frequency.
As I was attempting to design a Morse code audio decoder, the light dawned.

I guess you guys might be related? You don't seem to grasp
the idea that you don't HAVE to be conducting business on
the ham bands to find high speed data useful ... higher speeds
also allow more people to share a channel in a way that's
rather transparent to each other by sending the data they have
to send quickly, then allowing the channel to be used by others.

There are many potential, interesting applications for truly high
speed data in amateur radio ... the fact that you guys either don't
recognize them, or don't find them interesting yourselves, is
```

irrelevant and does not negate the fact that they exist.

I guess that's because nobody builds product that just does
the original .11 spec any more because the market's moved
to .11b because of the large increase in data rate, and you
couldn't sell a product that *just* did the original .11 modulation
any more ...

[snip for brevity]

I have tried to offer information to correct your missunderstanding
of the capabilities of 802.11b products. However, I don't view this
forum as an advertising medium for the company I work for and I
don't want to be accused of commercialism, as I have seen some
be attacked for that in the past.

"It" can ... honest. However, you seem to think that my employer
has "an obligation" to include information on its' packaging that
will inform the most un/ill-informed amateur that he/she could
potentially use the product in amateur radio ... as I've pointed
out (and Ed has also stated), there isn't enough space on the box
for such "extraneous" information and the potential market to
amateurs is so small that it's not worth pursuing (for any large-scale
manufacturer, not just the one I work for ...)

FHSS and DSSS have both been around for many years in both
professional and amateur literature ... your argument doesn't seem
to hold water ... with all respect, I still think you could benefit
from
a tutorial.

Actually, not "all" hams have it "entirely at their own expense". Many
emergency preparedness groups (RACES, etc.) have equipment
that is bought for the hams' use.

Just a minor point.

Cheers,
Bill K2UNK

Interesting. I don't hold back when I'm online, while I'm more prone to in
real life. The other thing about the "online" experience is, as we talk
face-to-face we can tell by others' expressions what impact our point is
making and modify the delivery based on what we are trying to communicate.
Often, written comments are taken far more literally than they should be.
For instance, N2EY would respond to this very message with, "Kim, we have
never talked face-to-face..." :) He'd say that because I used the word
'we' in the communication that he was confused because he thought I was
talking about he and I.

At any rate, reflecting upon myself is something that I don't mind in
anything I've said. I am way too reality based and have been told that many
times, as criticisms from bosses, friends, my darlin' hubby, etc. But, I
cut to the chase. I don't like wasting time on beating around the bush.
That's even rougher in the written word.

Thing I always realize here, and one of the reasons why nothing said gets
under my skin, is that the people who say the really mean things are people
I envision having a huge chip on their shoulder, and they just don't like

life in general. Why should I allow myself, or them, the time? ;)

Don't know. I think "Jay" spent so much time describing the trophies he got that he forgot to mention it. Doubt wherever it was would change my impression that he's more impressed with getting paid for the time off, has a new set of coveralls, and even got to keep a facemask.

Do you mean that for the Novice/Technician Plus CW only and CW/SSB
subands???
There're plenty of modes that they're arbitrarily prohibited from using.
In my book, only the power limitations are justifiable.

> >When you say data/cw you are omitting RTTY. Did you mean that?

> I probably should have said digital/CW.

Wrong, you should have said CW/RTTY/data... ;-)
Using the word 'digital' is a wrong as using the word 'voice' the FCC Part
97 defines neither. OTOH, the ARRL FFC Rule Book does mention 'digital
voice' and the sidebar says in part...

...emmision designator might be J1E. Transmission of such signals would be
in the phone bands...

They, also, say 'digitized voice' also called 'quantized phone' is not
data... hmmmm... We ARE talking government here... ;-)

The other thing to mention here is that CW AND 'digital' can be used on all
frequencies in HF. Another reason not to use the word 'digital'. heh heh

Not TOO confusing is it???

Well, you know how it is with those NCI folks, Ed. They have a lock on "how it's supposed to be" and nothing anyone else has to say means anything at all.

So we have about 75,000 upgrades and an increase on total numbers of
licenses of only 8,336.

Looks like basically a bargain basement
"gimmee" for all those already licensed who were too unmotivated to upgrade
without it.

Really, Jim, it could make you wonder if he is that familiar with what is
really going on in ham radio.

I "experiment" with new modes often, sometimes continuously for
days, during my hobby activities. I know nothning about designing
new whizzy modes, so I'm completely satisfied to experiment with
the results offered by those who do. Does that make me and the many thousands
like me "retro" and "doesn't seem interested"? If so, there has been a gigantic
shift in what is expected from hams, for there has never been any serious
percentage of ham radio ops involved in
the development of new modes nor equipment to use them. And nearly all of those
hams who were also were employed doing exactly that as their life's vocation.
Darn few "ordinary" hams have ever stumbled onto major advancements on their
own.
I fear Ed has been hoodwinked by the likes of Carl Stevenson.

Cuz BigRadios.Biz sales are at stake. If illegal CBers start seeing
proof that their overpowered outband rigs interfere with stuff then it
could affect Train's ability to sell his cb amps and crappy doctored
radios.

Cecil, What does that mean? The audio frequency is dependent on where you tuned it. you can tune it down to 20 Hz and that means 40 samples/second. What happens if you tune to 5 Hz? I would think that you'd want to shoot for something on the order of sampling 100 times the average beep rate... that would keep your sampling rate directly proportional to the character rate. At least you'd always be in the right order of magnitude... ;-)

Hey. I've got mine (such as they are). That's all that matters to me.

The code requirement, which it seems you want to discuss, will be gone
within a few years. That's just the way it is. But I just can't resist
poking some fun at some of the stupid excuses people come up with for
getting rid of it.

It was a joke, Ed. You know, work equals force times distance. Cecil
talked extensively about how the FCC applies force to it's applicants. In
his post, he said the work was equal to zero. If we assume the force the
FCC applied was not equal to zero, then distance he went must have been
zero. Get it? It's physics humor. Didn't you laugh?

I can't believe you of all people would say that. I remember your gospels very well. (Better than you it seems.) You were forced by the power of the federal government, the rule of law to take that code test. We all were - unless we obtained our license illegally. How you learned code is completely irrelevant to that fact.

==>PRESIDENT BUSH ADDRESSES FLORIDA ARES NET

President George W. Bush spoke January 31 via Amateur Radio to members of the Northern Florida Amateur Radio Emergency Service Net (NFAN). The president was in Florida to spotlight five volunteer groups for their value to the new Office of Homeland Security--among them the Volusia County Amateur Radio Emergency Service (ARES).

"I want to thank all the volunteers who help make sure that Florida is prepared for any kind of emergency," the president said in part, after checking in around 9:15 AM to a regular session of the 75-meter ARES net. "I want to thank you all for helping your communities be prepared."

Northern Florida ARRL Section Manager Rudy Hubbard, WA4PUP, said Bush spoke from a portable station set up at a Daytona Beach-area fire station. At the request of ARES Volusia County Emergency Coordinator Joette Barnett, KG4HPN, John Schmidt, AF4PU, and Clifford Fraser, KE4HIY, arranged to have the station ready as a demonstration of Amateur Radio's role in emergency preparedness and in the hope that Bush would be willing to address the 75-meter net. Hearing the president check into the net was a pleasant surprise, Hubbard said.

ARRL President Jim Haynie, W5JBP, said he was "extremely gratified" that President Bush recognized the valuable service Amateur Radio operators provide in times of emergencies. "I know that all hams in the United States stand ready to do their part in America's Homeland Security Program," Haynie commented. Haynie has said that defining Amateur Radio's role in homeland security would top his list of initiatives for his second term.

Hubbard said a copy of proposed expanded Amateur Radio antenna (PRB-1)legislation was given to the President and to the president's brother, Florida Gov Jeb Bush, for possible introduction in next year's Florida legislative session. "We Amateur Radio operators will volunteer however we're needed, and maybe it will be seen that we can greatly help the nation if we have the antennas we need," Hubbard commented. The proposed bill would seek to extend Florida's PRB-1 law to include private deed covenants, conditions and restrictions.

Bush's stop in Florida was part of a swing through the southeastern US, which also included stops in North Carolina and Georgia. The Daytona Beach event marked a rare appearance on ham radio by a sitting president. Former President Gerald Ford spoke via a ham radio satellite hookup in 1986.

> the days of Moses and before for that matter.

probably due to the increasing mean age of hams... when I got my license at age 15 I felt like a young'un. not much has changed.

Carl -- can you point to any "cutting edge commercial technologies" which can replace SSB?

"the herd" seems to have skipped ham radio entirely and gone on to land-line connections running TCP/IP over a variety of media.

> So here we be in RRAP which is overloaded with far-end techos bitching

I know the feeling, but I have resigned myself to the fact that analog is
just more fun. Aren't you simply describing oversampling in an analog to
digital conversion? DSP is what you do with the signal after that. Math in
the digital domain gives me a headache. Reading a half page of integrals is
about as much as I can bear. I start to lose the gist of things after that.
I guess I'm just another one of these guys who proves Carl and Ed's point
about the worthlessness of amateur radio operators.

I guess my mileage varied significantly. my first exposure to 802.11
networking (the non-frequency hopping kind) came to me in the form of a
couple of AT&T/lucent wavelan cards. the outside of the box gives a
nebulous "features spread spectrum radio transmission in unlicensed
bands (915MHz or 2.4GHz depending on country regulations)" and cracking
open the manual reveals that the channels must be set manually.

> Had that been among the boxes I had picked up and read, we wouldn't be
> having this discussion. However, that product might be the exception,
> not the rule.

looking at the documentation that came with my original wavelan cards,
they don't even mention 802.11. but that was 1996. but I now see how
you came to your conclusion.

when you start getting into fully automated networks, control links can become the rule -- not the exception. unattended automated mail delivery comes immediately to mind.

> Why would hams want normal everyday stuff encrypted?

for amateur radio, you basically trade-off privacy for privilige, so by definition, if it's a private communication, it's not for amateur radio. ;)

Don't blame the ARRL. While I have little use for the organization, it
was the screaming by Hams to get rid of the CW requirement that generated
the restructuring.

I personally believe that the restructuring that is being used is wrong.
Novice should be the entry level for HF, Tech for above 30 meters, with
Extra being the third class. Keep General if necessary, but there is no
real need for it.

I also believe that the written tests should be made more rigorous again.
They are trivial to pass, right now.

Of course we all have our differing opinions. As a 13 wpm General I feel slighted that a 5 wpm tech is to be shoved into my slot without ever having to pound a key. I dislike it, but I will live with it. It is for this same reason that I hesitate taking the written test for Extra. It seems that the Extras resent those of us that test "up" to Extra....after all, they earned their ticket the hard way and they see us newbie Extras as interlopers. They feel that I should not be an Extra since my 13 wpm did not meet the criteria.
Me? Heck. I don't care one way or the other.
You won't see me jumping forth to join the ARRL...I have better things to do with my time and money.
The old codgers who claim that it is the ARRL or nothing are fighting a losing battle. In light of the fact that only a third or less Ham Ops belong to the ARRL speaks volumes.
I like my hobby. I do NOT need the ARRL in any way, shape or form. They have done nothing for me and I doubt they will any time soon.

>Oh. So it couldn't be Fred who Bruce is talking about. I knew you would
>know, Ed. Thanks for the help.

Sure. And, for the record, I believe that ARRL has a good relationship with Fred, too, some differences of opinion notwithstanding. For whatever reason, Fred chose to become involved with the FCC on the RF-safety rulemaking matter, and he and I exchanged a fair amount of information. As I put some of my technical viewpoints before the Commission, I also put Fred's differing viewpoints on the table, at Fred's request. It saved everybody a fair amount of time.

Fred is in the commercial exams and study guide business. Although those study guides do compete with those of other publishers, that doesn't mean that all aspects of the ARRL/W5YI relationship are adversarial. Fred's ARRL membership is, IMHO, sincere, and stems from the same reasons mine does -- to support the good work of ARRL and to gain influence to shape those things we feel need to be done better.

That is a pretty odd thing to say, Dick. Do you really think I don't read QST?
Sorry.

I recall some really cool experimentation being featured in QST, but not
"lots." Can you elaborate a bit more and explain how many makes a "lots" to
you?

Jim/N2EY, now I see what you mean by that "fear" thing. Dick's afraid to deal with the fact that the prediction of the end of the ARS was wrong. He's got to come up with some other totally off-base reason for the numbers as he sees them (note I said as *he* sees them).

My first question would be: Who is doing the expecting? My puke...er,
regurgitation would be that it sure does make you (I'll leave out your
probable fictitious "thousands") "retro" and "uninterested." Isn't that
what you like to say of others? Yeah, this regurgitation game works *TWO*
ways, eh?

GASP You responded directly to a post from *me* Dickie. Does this
mean...? Could this mean...? Ya mean ya aren't *cough* i-g-n-o-r-i-n-g me
anymore?! Note to self: mark this point, Dick's backed up on nearly every
post I've read this morning; he'll back up on this one, too.

Back to Dickie: after the posts I've seen this morning from you, if I were
you I wouldn't even be *pretending* to argue yourself into being smarter
than someone else. Or impressed, for that matter. Could ya perhaps 'splain
how you got that I was talking about someone being impressed with theirself
from the comments above? I'd really like to see the explanation you have
for that one. Go ahead, it's OK. I have all day.

(Psssst, hint: I said Jay is impressed with the goodies he got. I have no
idea if he's impressed with himself. *Try* to keep up, would you?).

The audio frequency depends on the filter and is usually in the
neighborhood of 600Hz-800Hz. If you make the sample rate double
the audio frequency, all the coefficients are either zero, one,
or minus one - no multiplication needed.

3265. 70cm Band Threat

Newsgroup: rec.radio.amateur.policy
Date: 2002-02-02 15:32:37 UTC
From: W5TIT - Kim <seventythree@eightyeight.net>
Message-ID: <3c5c0838_2@newsa.ev1.net>
Source record: 32778

I've posted the below article from The ARRL Letter, Vol. 21, No. 5, February 1, 2002. I'd like to see the 70cm preserved without interference from such sources as noted in the article. However, I do wonder how populated the 70cm band is in other places than my own. The reason I ask is to formulate some comments that I'll write myself to the FCC regarding the topic below.

Here in the Dallas area, as often as I've listened or been on 70cm (which, granted has been a small percentage of time), I have not heard a lot of activity. Others in this area have made the same observation. This, however, was prior to the widening use of technologies such as IRLP. I wonder what the band-use is in other areas of the country. Are there technologies on the horizon that will call for an even greater appeal to the 70cm band?

While not a valid "argument" to defend 70cm, how would you go about making the band more appealing? By that I mean, usually, new hams first get the 2M handheld, then the 2M mobile, then we hear of them shopping around for a dual-band mobile. More times than I care to reveal, the typical response to them is: "Why do you want to spend the money on a dual-band--there's nothing on 440?" We can't, of course, say to the FCC, "we are going to be needing that space." 70cm often comes under threat and I think (due to my operating area) that it is because we don't use the band that much. It sure would be nice to see it become more active, thus making it maybe less desirable as a target.

I note that in the ARRL article below, there is comment made as to 70cm being "one of the most popular of the Amateur Service allocations" and this area (I don't think) is no testament to that. How's the popularity of the 70cm band where you are? Anyone have any thoughts for other ideas on this matter to the FCC?

Kim W5TIT

==>ARRL GOING TO THE MAT ON 70-CM BAND THREAT

ARRL officials met recently with FCC staff members as part of the League's effort to stave off a band threat on 70 cm. ARRL General Counsel Chris Imlay, W3KD, and Technical Relations Manager Paul Rinaldo, W4RI, delivered an ex parte presentation to FCC Office of Engineering and Technology staffers on January 14. At issue was SAVI Technology's plan--already tentatively agreed to by the FCC--to deploy unlicensed transient RF identification devices between 425 and 435 MHz at much higher field strengths and duty cycles than Part 15 rules now permit for such devices. RFID tags are used to track and inventory parcel shipments.

"We told them that this was the worst possible choice of bands for these RFIDs," Imlay said. "Besides, there's no technical justification for that choice of frequencies." The request to use 70 cm has more to do with economics than technology, he said, because SAVI needs to bring down the cost of RFIDs in order to make a profit.

Imlay added that the ARRL would "do whatever it takes" to stave off the threat, including further direct appeals to FCC staff. The ARRL plans to file "strongly worded" comments on the SAVI petition by the February 12 comment deadline. Reply comments are due by March 12, 2002. Imlay said he was assured that SAVI's request "was not a done deal."

The FCC acted on the SAVI request last October in an FCC Notice of Proposed Rule Making and Order (ET Docket 01-278). The ARRL argued in comments filed last March that the field strengths and duty cycles SAVI proposed for its RFID tags as Part 15 "periodic radiators" were unreasonable and "would undoubtedly seriously disrupt amateur communications in one of the most popular of the Amateur Service allocations," particularly for weak-signal enthusiasts.

The League also believes the FCC lacks the statutory authority to permit the RFID tags under its Part 15 rules in the configuration SAVI has requested. The ARRL argues that under the Communications Act of 1934, such devices with substantial interference potential must be licensed. The ARRL also has suggested that SAVI pick one of the Industrial, Scientific and Medical (ISM) bands instead of 425-435 MHz.

The ARRL's January 14 ex parte presentation was complemented by an interference study prepared by ARRL Lab Supervisor Ed Hare, W1RFI, and ARRL Senior Engineer Zack Lau, W1VT. A copy of the interference study and more information is available on the ARRL Web site "Band Threats" page <http://www.arrl.org/announce/regulatory/rm-1005/SaviExParte.pdf>.

I think it's been about 30 years since I used a slide rule. You'll have to
show me how you work differential equations on one.

Actually Ed, since you're the one taking issue with Dick about "lots", you
need to explain how many "lots" and "some" are, in order to support your
point of contention about it.

Nope. The number of upgrades. Were have you ever seen such a surge of upgrades before? Never. It's the antithesis of Incentive Licensing, where the goal was to actually learn more radio. Here the goal was simply "get the numbers up".

I'll say it again, it's clear the goal of the recent restructuring was to merely get the numbers up, both in new hams and upgrades, as opposed to that of Incentive Licensing which was to learn more radio and prove it by taking and passing difficult exams. No wonder so many longtime hams feel contempt for the currently trendy viewpoint.
Do I want people to upgrade? Just for the sake of them holding a higher class license for which they were required to do little or nothing significant? What's the point?

> you?

Evidently you take different information from what you read in QST than I. I get the idea that there *are* a lot of leading edge hams dlong interesting things with new technologies. Even me, one who doesn't write software nor design anything digital, a leftover from the analog age. I still do a lot of computing on ham radio, hey, I even recently bought a new 1.1 Ghz computer running Windows XP just to play ham radio with. Runs MIXwin really well, and I wasn't sure that XP would do that until I tried it. The hams who got MIXwin together were doing some neat things with technollogy. I get to benefit by being able to follow up and use the fruits of their work. Dots that leave me out of the list of "lots" of hams doing things with newer technologies? Gee, I hoped you would think that guys like might number in the "lots" right along with the geeks who design the stuff. There are clearly "lots" of them, out there, too, tho most of them clearly are employed in the field. Certainly nothing wrong with that. As a young fellow I did that with the things I learned as a ham, and spent a career doing. I applaud the guys who still do that, tho it is dissapointing that many of them seem to fail to realize what got them where they are,what went before, and have little or no regard for the rich history and traditions of ham radio.

What *really* shows their lack of understanding is how they act toward anyone who acknowledges the communications value of CW, even in the face of technology, to be a retro or Luddite, whatever else they're doing. Makes them look a bit dense, doesn't it?

BTW, I was disappointed to find that MIXwin works PACTOR on receive only. If it would transmit also that would be the complete digicomm program for hams. Any idea if they plan to upgrade it to PACTOR transmit also?

Amateur Radio Newsline™ Report 1277 – February 1, 2002

Amateur Radio Newsline report number 1277 with a release date of Friday, February 1st, 2002 to follow in 5-4-3-2-1.

The following is a Q-S-T.

The President of the United States speaks to hams in Florida and is ham radio seeing a second Solar Max? These stoies are first on amateur Radio Newsline report number 1277 coming your way right now.

(Billboard Cart Here)

**

BREAKING NEWS: PRESIDENT BUSH COMES TO HAM RADIO

The President of the United States has come to ham radio. Bill Burnett, KT4SB, has the details:

--

President George W. Bush has taken to the ham radio airwaves. This, to thank the Florida Amateur Radio community for being ready to serve the public when it is needed.

The President’s comments were made during a stopover the morning of January 31st at the Volusia County Fire Services and Training Center near Daytona. Around 9:15 AM Eastern Time, President Bush checked in to the Northern Florida Amateur Radio Emergency Service Net on 3.950 MHz using a portable station set up John Schmidt, AF4PU. Then the President made these remarks to the 40 or so stations listening to the net:

--

President George W. Bush:

"I want to thank all the volunteers who help make sure that Florida is prepared for any kind of emergency. I also want to assure you that your Federal government is doing everything we can to make sure that there is not an emergency--starting with unleashing the mighty U.S. military overseas to bring evil ones to justice. But should there be a need for a response, I want to thank you all for helping our communities be prepared. And finally, I want to tell you--we are lucky to be Americans and may God continue to bless this great land of ours. Thank you very much."

--

Needless to say the net members were delighted to have the President of the United States address them. More important, hams nationwide can now be sure that President Bush knows that Amateur Radio operators are ready to serve whenever he, and the nation, needs to call on them for help.

In Miami, I’m Bill Burnett, KT4SB, reporting for the Amateur Radio Newsline.

--

The complete story is on the web at
http://firstcoastcommunity.jacksonville.com/northfloridaamateurradiosocietynofars (Tnx NU4F, CQ Magazine)

**

HAM RADIO SCIENCE: TWO SOLAR MAXIMUMS THIS SEASON

In case you are wondering why the current solar cycle is still providing such amazing VHF and UHF DX, one researcher may have the answer. He says that the current cycle appears to be having a second peak and that this is really not very unusual. Henry Feinberg, K2SSQ, looks at the scientist and his latest data.

--

The most recent and ongoing Solar Maximum -- or Solar Max -- theoretically crested in mid-2000. Sunspot counts were higher than they had been in 10 years, and solar activity was intense. One remarkable eruption on July 14, 2000 caused brilliant auroras as far south as Texas. But after that, sunspot counts slowly declined and the Sun was relatively quiet for month-long stretches. Most scientists said that the Solar Max was over. But was it?

Now, as 2002 unfolds, the National Aeronautics and Space Administrations solar foorecasters say that it looks as if the Solar Max is back with us again. The Sun is again peppered with spots, eruptions are frequent and hams notice that the VHF DX keeps rolling in.

Why is this happening? Well David Hathaway, a solar physicist at the NASA Marshall Space Flight Center in Huntsville Alabama has one theory. Hathaway says that the current solar cycle appears to be double-peaked, and the second peak has arrived.

--
Hathaway Audio Here
In-Q: We have seen other cycles...
Out-Q: ...define this maximum
--

Scientists track solar cycles by counting sunspots and Hathaway is an expert forecaster of sunspot numbers. He says that sunspot counts peaked in 2000 some months earlier than we expected. He says that the subsequent dip toward solar minimum seemed premature and before long, sunspot counts reversed course and began to climb toward a second maximum that now appears to be only a few percent smaller than the first.

--
Hathaway Audio Here
In-Q: Its a bigger than average...
Out-Q: ...smaler than 19, 21 and 22.
--

Hathaway notes that there is a widespread misconception that solar activity varies every eleven years like a pure sinusoidal wave. It isn't. He says that solar activity is chaotic and there can be more than one peak in any given period. Translated for ham radio: Enjoy the VHF DX while you can.

For the Amateur Radio Newsline, Henry Feinberg, K2SSQ.

--

Hathaway says that the Solar Max eleven years ago was much the same as this one. The first peak arrived in mid-1989 followed by a smaller maximum in early 1991. And if you are interested in hearing more about this interesting phenomena from David Hathaway its as easy as taking your web browser over to www.rainreport.com. Or you can call on the phone to area code 847-827-7246. (NASA, RAIN)

**

HAM RADIO IN SPACE: HF ANTENNA INSTALLED ON ISS

High Frequency ham radio operations from the International Space Station could be on the not to distant horizon. This, after a successful space walk on January 25th to install another antenna on the orbiting outpost. Amateur Radio Newsline's Roy Neal, K-6-D-U-E, has the details.

--

The spacewalkers have had another good day in space. On Friday the 25th of January, Cosmonaut Yuri Onufrienko, RK3DUO and Astronaut Dan Bursch, KD5PNU, successfully mounted a second ham radio antenna near a docking port amidships on the International Space Station. It is made of flexible tape and is similar to but longer than another antenna installed on January 14th. That one tunes both VHF and UHF frequencies. The new antenna will tune HF frequencies.

ARISS Board Chairman Fran Bauer, KA3HDO, says it definitely will work on ten meters and may even be made to work on 15 and 20 meters. BUT right now there is no gear on board to handle those frequencies. Experiments using the lower frequencies are on the list of futures for ARISS but no timetable has been assigned to design and build them.

Owen Garriott, W5LFL, the first man to operate ham equipment in space, once prophesied that a five watt transmitter in orbit might well be heard simultaneously world wide. The great number of hams with good stations on the lower frequencies also makes them enticing to ARISS. It's a safe bet that serious consideration now is being given to expedite such a project. Once a station is sent up, the antenna will be waiting.

The new antenna is the second of four to be installed on board the space station. No timetable has been announced for the final installation. All of

these amateur antennas were built by Italy, tested and qualified in the US, to fit ports built by Russia, as befits the international nature of the ISS.

For the Amateur Radio Newsline, Roy Neal, K6DUE

--

Installation of the 2.5-meter long flexible tape antenna involved not only the mechanical deployment but routing cables and establishing the R-F connection as well. (ARISS)

**

HAM RADIO IN SPACE: THAT ANNOYING SATELLITE IS OFF 2 METERS

An annoying mystery satellite transmitting AFSK, frequency modulated Morse on 144.100 MHz for several days has been identified. It turned out to be a signal from the MAROC-TUBSAT satellite. This is an Earth-sensing spacecraft owned by a Moroccan government agency called he Royal Center for Remote Sensing. It was placed into a polar orbit by a Russian launcher on December 10, 2001.

As soon as he learned of the interference to amateur operations, Professor Udo Renner of the Center had the 144.100 MHz transmitter turned off. He then notified AMSAT Germany that TUBSAT was no longer on two meters.

But TUBSAT also has a downlink at 436.075 MHz. This system is only busy over North Africa and Europe and only when the control stations in Rabat and Berlin are activated. It has not been heard elsewhere in the world. (AMSAT-NA)

**

Break 1

From the United States of America, we are the Amateur Radio Newsline, heard on bulletin stations around the world including the Pentucket Radio Club repeater serving Groveland Massachusetts

(5 sec pause here)

**

SPECTRUM PRESERVATION: ARRL SAYS IT WILL FIGHT TO KEEP RFID OFF 70 CM

The ARRL says that it will go all the way to protect the 70 centimeter ham band from a threat brought by commercial interests. At issue is a plan from SAVI Technology and already tentatively agreed to by the FCC to deploy unlicensed transient R-F identification tag transmitters operating between 425 and 435 MHz. These tags run at much higher field strengths and duty cycles than Part 15 rules now permit.

According to a League bulletin issued on January 29th, ARRL officials have already met with members of the FCC staff as part of the League's effort to stave off a band threat. The bulletin says that General Counsel Chris Imlay, W3KD, and ARRL Technical Relations Manager Paul Rinaldo, W4RI, delivered an ex parte presentation to FCC Office of Engineering and Technology staffers January

14th outlining the opposition of the ham radio community. (ARRL)

**

FCC: CHAIRMAN POWELL HOME AFTER HOSPITAL TESTS

Federal Communications Commission Chairman Michael Powell was discharged from the hospital on Friday January 25th. This, after a two-night stay in the to undergo tests because of a lingering stomach bug.

Stomach discomfort caused him to cancel appearances at the Consumer Electronics Show in Las Vegas on January 8th and again at the annual conference of the National Association of Television Program Executives on Wednesday January 23rd. Doctors advised precautionary tests that required overnight stays at Walter Reed Army Medical Center in suburban Washington. (Published news reports)

**

ENFORCEMENT: THAT SONG WAS NOT AS BAD AS WE THOUGHT

The Federal Communications Commission has dropped an indecency fine against a Colorado radio station. KKMG FM of Colorado Springs had been fined seven-thousand dollars for airing the edited version of Eminem's "The Real Slim Shady." This, after a listener wrote the regulatory agency to complain.

At the time the fine was issued federal regulators said the edited version still included some expletives and references to violence and graphic sex. But the FCC now says it has reconsidered. It now says that the lyrics in the edited version didn't violate its rules by being "patently offensive." (FCC)

**

RESCUE RADIO: BRAZIL RADIO OPERATORS HELP IN POWER OUTAGE CRISIS

A major electricity blackout hit at least five Brazilian states on January 21st, and it was hobby radio enthusiasts that let people know about it.

The blackout, which began at 1:30 p.m., hit hardest in the industrial southeast and the major cities of Sao Paulo, Belo Horizonte, Rio De Janeiro, Goiania, Vitoria and the capital, Brasilia.

According to news reports, Brazil’s National Energy Agency blamed the outage on transmission line failures. The same news report credited Brazilian hobby radio operators as informing authorities that subways in Rio De Janero and Sao Paulo were halted and that traffic lights were out snarling commuters in several areas.

The outage was caused by a failure at the Itaipu hydroelectric station in southwestern Brazil. A power-line failure caused thirteen of the dam's eighteen turbines to stop, cutting off nearly 20 percent of the country's energy. Power was restored about three hours later. The news story did not identify the radio operators as being hams. (Various shortwave news reports)

**

RESCUE RADIO: NEW INTER-JURISDICTION RADIO SYSTEMS BEING INTRODUCED

Santa Clara County California, police, fire and emergency medical personnel have never been able to communicate with one another at the scene of a major disaster. This is because each agency uses a separate radio system. That is expected to change this year.

Santa Clara County will be leading the nation in using new digital radio technology to solve the inter-agency communications problem. The new system will allow up to eighteen participating jurisdictions in any county to talk to one another instantly.

By way of example, once the system is up and running, officers involved in one of California's famed high-speed car chase will be able to talk directly to police in the neighboring jurisdiction as the suspect approaches that town. They won't have to switch channels or go through dispatch centers. This means less time wasted and the probability that lives will be saved.

While Santa Clara county is at the head of the pack in adopting this new digital communications technology, the same news reports say that and Washington, D-C is not far behind. (Cal-State Info.)

**

PUBLIC RELATIONS: A CHEAP SATELLITE

A Cheap Satellite is the name of an Associated Press item that highlighted the work of the faculty and students at the United States Naval Academy in the development and launch of the P C Sat ham radio satellite. The story tells how the twenty-five pound bird was built using off the shelf products including a tape measure for its antenna and rechargeable double A cell batteries for power.

The story was written by Tom Stuckey and moved on the wire on Wednesday January 23rd. It noted that PCSat, was the 44th amateur satellite put in orbit. It is one of more than a dozen built by university students around the world. (VHF Reflector)

CONVENTIONS & HAMFESTS: ORLANDO HAMCATION WEAK SIGNAL FORUM

The Orlando HamCation will host its first ever Weak Signal VHF and UHF forum. Beginning at 2 p.m. on Saturday Ferbruary 9th, the one hour session will be moderated by N2CEI, of Down East Microwave. Also, Tom Haddon, K5VH, will be on hand to motivate more Florida hams to become active on the Microwave bands.

If you are in the Orlando Florida area on February 8th to the 10th drop in on the Orlando Hamcation. For more details and or advance reservations, go to oarc.org/hamcat.html on the World Wide Web (W2BZY)

**

CONVENTIONS & HAMFESTS: DATE CHANGE FOR RADIOFEST 2002

Brian Broggie, W6FVI, asks that we pass along a date change for RadioFest 2002 sponsored by the Naval Post Graduate School Amateur Radio Club in Monterey California. The new date is February 23rd. More information is in cyberspace at k6ly.org/radiofest. (W6FVI)

HAM RADIO SCHOLARSHIPS: THE DARA SCHOLARSHIPS

The Dayton Amateur Radio Association is one of three ham radio organizations seeking nominations for its scholarship program for the 2002-2003 academic year. According to DARA, applicants must be graduating high school seniors in 2002 and hold any class of an FCC issued mateur Radio license. The scholarship awards run up to $2000, as determined by the scholarship committee. Money must be used toward tuition at an institution of higher education.

To obtain an application, send a self-addressed, stamped envelope to the Dayton Amateur Radio Association Scholarship Program, 9873 Lower Valley Pike, Medway, Ohio 45341. You can also obtain an application by e-mail to n8emo1@msn.com. Completed applications must be postmarked no latter than June 1st to be eligible for this years scholarship program. (DARA)

**

HAM RADIO SCHOLARSHIPS: THE FOUNDATION FOR AMATEUR RADIO

Another organization offering scholarships to hams id the Foundation For Amateur Radio. The Washington, D.C. area group will administer sixty-two scholarships for the academic year running from 2002 through 2003. Licensed Radio Amateurs may compete for these awards if they plan to pursue a full-time course of studies beyond high school and are enrolled in or have been accepted for enrollment at an accredited university, college or technical school. The awards range from $500 to $2500 with preference given in some cases to residents of specified geographical areas or the pursuit of certain study programs. Additional information and an application form may be requested by letter or QSL card to the FAR Scholarships, Post Office Box 831, Riverdale, Maryland, 20738. (Foundation For Amateur Radio)

INTERNATIONAL - SOUTH AFRICA: SA RADIO AMATEURS OF THE YEAR NAMED

Turning to international news, South Africa is honoring two of its own as that nations Radio Amateurs of the Year. Q-News Graham Kemp, VK4BB, brings us the details:

--
The South African Amateur Radio Development Trust have announced the winners of the 2001 Siemens Radio Amateur of the Year Award. This award is made annually to a Radio Amateur who has made a major contribution to the Amateur Service either on a technical or development basis in ZS land.

The award has been bestowed jointly on Bradley Phillips, ZS5BP, and Garth Wilson, ZR6CY. ZS5BP for his work on the introduction of Iphone and the development of the Internet Radio Linked project. ZR6CY for his continuous efforts to develop communication skills amongst the youth. He has to date presented no less than 80 camps for Voortrekkers to learn the Morse code and basic communication skills.

For Q-News Australia, I'm Graham Kemp, VK4BB, reporting for the Amateur Radio Newsline.

--

This award is considered as South Africa's equivalent to the Dayton awards presented here in the United States. (SARL News, Q-News)

**
INTERNATIONAL - UK: KENWOOD TROPHY AWARDED TO G3XWH

Meantime, over in the U-K, Richard Horton, G3XWH, who chaired the RSGB's Future Licensing and Examination Forum has been awarded the Kenwood Trophy. This, for his significant contribution to training and development in amateur radio.

Horton recently retired from the Radio Society of Great Britain's Board where he was responsible for amateur radio development. His committee was responsible for much of the work that went into the creation of the new U-K Foundation Class license. (GB2RS)

**
DX

In DX, DJ4KW and DK9GG are currently active from Belize as V31YN and V31GW, respectively, through early February. Activity is on CW, RTTY and PSK 31. (RSGB)

And IN3QBR will be active from Vientiane as XW3QBR until the 31st of July. He will be joined, from the 20th of April until the 10th of May by IN3ZNR operating as XW3ZNR. (OPDX)

And R1ANF began operations as CE9 slash R1ANF on the 29th of December from a Chilean base in the South Shetland Islands. He is active on 10 to 28MHz with 100 watts to an R6000 vertical. For all three QSL as directed on the air. (RSGB)

**
THAT FINAL ITEM: CELEBRATING THE LIFE OF ED CLEGG W2LOY

And finally this week, if you were on the VHF bands in the 50's, 60's and 70's then the name Clegg Labs touched your ham radio operations. And as we hear in

this report, the family of the man behind the gear is inviting you to help celebrate his life.

--

Even if you did not own any Clegg gear, the chances are that you talked to someone on the air who did. Whether it was the top of the line Interceptor receiver and Zeus transmitter or the entry level 99'er transceiver, it was easy to spot a Clegg signal by its almost overpowering modulation that seemed just right for the R-F carrier it was on.

Almost every product that carried the Clegg label was designed by the company's founder Edward T. Clegg, W2LOY. When he moved the company to Pennsylvania in the 1970's, Ed took the call W3LOY. Likewise, after retiring to Ohio he traded the 3 for an 8, but kept the famed L-O-Y suffix.

And regardless of the call area, Ed Clegg was first and foremost a communications designer well ahead of his time. Even more important, he was a positive influence on just about everyone with whom he came in contact.

Ed Clegg left us last September at age 80. Now, his wife Martie will be hosting a gathering in March near the Clegg home in Lancaster Ohio. The purpose is to celebrate the life of Edward T. Clegg. And they are asking you to help.

Martie, her daughter Linda and Linda's husband Rob MacGuffie, K2HZN, are asking anyone who knew Ed to share in the celebration. They know that most of you won't be able to be in Lancaster Ohio on March 30th. But some of you do have memories, stories, photos and other Ed Clegg memorabilia that would help to make this day even more unforgettable.

If you have something to share, please contact Linda and Rob before the end of February. Their address is 70 Province Road, Gilmanton New Hampshire with a zipcode of 03237. Rob's cyperspace address is K2HZN@yahooo.com.

For the Amateur Radio Newsline, I’m Cathy Anno, KB0FDU.

--

By the way, a number of us here at the Amateur Radio Newsline began our ham radio careers using gear designed by Ed Clegg. In fact, our producer Bill Pasternak, WA6ITF, got to know Ed while Bill was still a teenager operating A-M on the 6 meter band. (Clegg family)

I've been a ham since 1968 and had my Extra since '74, so using your terminology, I took the tests "the hard way". I resent no one who enters our hobby no matter how he or she took any tests. And I do not consider a "newbie Extra" (your terminology) as an "interloper". Please don't wrongly judge many of us who have been in the hobby most of our lives and are happy to see ham radio thrive. Your note indicates that you are the one who is biased. We all share a common hobby, but sometimes I wonder.....

Skiing wasn't that great. Besides being very warm one day, like in the mid 50's, that storm over the past two days dumped more ice than snow so I came home to find this stuff. All I can say is WOW (not WHIP em OUT WEDNESDAY!)

Anyway, thanks Jim, if thanks can be said. It was done out a sense of duty for lack of better words. Several of my neighbors here in Bronxville lost family and when the call went out for any WECA club members with EMT experience, neither my wife nor my children complained that I was playing "radio" again, although this time, it was little if any radio. Several of my club friends were in the pit helping dig. Fortunately I only was at "ground zero" for 2 days. In all my life I will never forget what I saw. Mainly I was a block away, most of the time doing moderate EMT care, cuts, scrapes, a lot of eyewashing and nasal lavage.

As to Kim, what can anyone say. She asks a question and I answered. If the answer is so far over her head, tuff shit. I forget that the further you get away from the city, the more surreal the whole thing gets. There are people I talk to on HF still have a hard enough time try to envision what happen and you expect some "slightly" overweight broad who is proud of the fact she buys designer clothes from Omar the Tentmaker to understand? You are asking way to much.

I'd gladly trade in my "trophies" if the whole thing could be considered a do-over. But I wouldn't expect her understanding on this, better yet, from what I've seen she shows a regular lack of any understanding on many issues. She's what they call a Yenta..someone who sticks their big fat nose into everything whether they need to or not.

And yes Kim, I was impressed. Impressed with the huge number of people who dropped everything and came to help. From the 5 star chefs who came and cooked food 24/7 for everyone free of charge to the Mayor who up until that time I thought was a pompous ass until I saw the man break down and cry at the site of what was once a wonder of the world.

And I mentioned being paid because IBM doesn't pay for off time like this. Yes they are paying for employees called up to active duty, but never for someone just taking off for 5 weeks. However due to the situation and because it involved only several dozen people, Corporate decided we'd get paid so that we could continue what we were doing and

not have to worry about our finances at home...amazing stuff indeed. I wouldn't expect someone like YOU o understand but then again I'm not asking you to understand because you never will. To you, it's all some TV type news program that you see on your 19" RCA couple of times per week.

I am sure you'll puff up larger than life, if that's possible, with the "I knew people who died" get all huffy and stomp your little size 13's on the ground, but that's OK You go girl

That's all I have to say on the subject. I am not asking for the understanding on why I did it, I can't really explain it, but Kim if you think I did it for trophies or to impress you or anybody, you're a BIGGER stupid broad than ever I give you credit for.

Pictures of WECA's involvement can be seen at:

6 meters *is* DX for those that haven't upgraded yet

3286. CB Outlaws Make ALL Radio Ops Look Bad

Newsgroup: rec.radio.amateur.policy
Date: 2002-02-02 22:35:21 UTC
From: voobner@yahoo.com
Message-ID: <fbc7a2.0202021435.2a3ee7@posting.google.com>
Source record: 32797
Cross-posted to: rec.radio.cb,rec.radio.amateur.policy

I ran across the following story in a club newsletter.

At first glance it appears to be fuel for anti-ham/pro-illegal CB fires. But if you read closely, you can see that the ham in question has not only behaved responsibly, but he is actively being supported by both local and national ham organizations in dealing with the problem. Illegal CBers would never come forward to take responsibility, much less identify themselves.

Note the city council's reaction in paragraph 3. Anger and frustration. Can you blame them? The problem of high-powered CB outlaws running spectrally-dirty gear is epidemic throughout the USA. To the general public, a "radio operator" is one of these outlaw CB characters.

Most hams don't care what happens in the 11 meter band as long as it does not affect them. If they continue to maintain this policy they will face an increasing hostility in the eyes of the public who can't tell the difference between a licensed ham and a guy running 10 KW with an echo mike on channel 6.

-Aaron-

RFI COMPLAINTS, CITY COUNCIL INVOLVEMENT
FRUSTRATE MICHIGAN AMATEUR

Rob Underwood, W8YRB, says RFI complaints have him at his wit's end. The
Wyoming, Michigan, ARRL member says his efforts to resolve some neighbors'
complaints of stubborn interference are at an impasse. To add to his frustration, the Wyoming City Council now has asked the FCC to step in, and
the situation has erupted into a media spectacle that, he says, hasn't done
much for ham radio's image.

The FCC's position with respect to RFI to consumer devices is that the consumer device--telephone, stereo, TV or other appliance--most often is to
blame, and that consumers need to deal with appliance manufacturers. Underwood says he's gone the extra mile to resolve interference complaints,
but one neighbor a half block away has become especially intractable,

pinning blame for interference to her telephone and touch lamp squarely on
him. The woman ultimately complained to the city council, which met January
21 and unanimously agreed to contact the FCC.

****Underwood said city council members "threw their hands in the air, and most
of them said it was my station that needed to be 'filtered' and didn't want
to hear what my solutions were." ****

Twenty one amateurs reportedly attended the
council meeting on Underwood's behalf, and one Council member praised
Underwood's attempts to assist and to educate everyone.

Underwood said, however, that several other neighbors turned up at the
session with new RFI complaints he hadn't heard before. He's volunteered to
assist them. Underwood says media coverage has focused on the neighbors'
complaints rather than on his efforts to respond to them.

The neighbor's touch lamp seems especially susceptible to RFI and even
flickers when he keys his 100-W mobile transmitter while driving by her
house, Underwood said. Although he installed some ferrite chokes on the
lamp's power cord, the problem persisted. The neighbor has refused further
offers of help.

Underwood reports that his own home is essentially free of RFI problems,
with the exception of his cordless telephones when he runs his amplifier. He
said he installed RF chokes on telephone equipment for his immediate
neighbors who had complained of problems, and they have not reported any
interference since.

Underwood has the full support of ARRL Michigan Section Manager Dick Mondro,
W8FQT, who noted that the FCC Detroit Field Office was also aware of the
problem and has been cooperating in resolving the issue.

ARRL provides information and resources to deal with RFI problems on the
ARRL Web site's RFI pages .

>
>In one form or another, we have had code testing since day 1 in Amateur
>Radio.

Well, since 1912. Amateur radio existed before then, however.

>Hey, wasn't the first code test at 5 wpm? :-)

From 1912 to the 1917 shutdown for WW1. When hams were allowed back on the air in 1919, the test speed was 10 wpm.

>Over all of these years
>Amateur
>Radio has supposedly been crippled, it has grown and flourished.

Yup. Which disproves Bruce's claims.

> The only
>"leading indicator" is that the growth picked up with the no-code tests and
>appears to be picking up with the 5 wpm change.

Show us your numbers, Ed. What was the growth per year in the time periods before the Tech lost its code test in 1991, after that change, and before and after
the 2000 restructuring?
>
>In my personal opinion, though I have one on code testing, it is not that big
>of a deal one way or the other.

I think most hams feel the same way.

>It is a major leap to go from a belief that
>it
>is time to replace Morse testing with something else to it is "crippling
>Amateur Radio."
>
I'd go a step farther. Representing code tests as "crippling amateur radio" and "digging our heels in the past" does no good. In fact it does lots of damage by

diverting focus from the REAL problems confronting ham radio, like lack of publicity, RFI, antenna restrictions, band threats, etc.

John,
I'm about 2-3 years behind you in Novice and Extra. When I got my Extra
they were doing the multiple choice code test at a Hamfest instead of
solid-copy under the watchful eye of the FCC-marm in the Atlanta office,
a 5 hour drive away (or 5 days if you had to walk barefoot in the snow
carrying a load of firewood). The written test had been 'watered down'
to where it was easier than my Advanced. You'll probably recall that
that Extra was considered 'cheapened' at the time. And there was a time
when I wouldn't be caught dead with one of those newbie calls like I
have now.
Yes indeed, these little arguments fade with time. I don't think ham
radio is in danger of being overrun by people who aren't interested and
just get a license or upgrade because they are bored that day.

Where? There isn't anywhere near the level of congestion in the
vhf/uhf ham bands to justify implementing schemes like that. And there
isn't enough bandwidth on the HF bands to provide "clear channel
comms" everywhere for everybody especially for complex data like
digitized voices, never mind full-blowm multimedia comms like we have
with the Internet.
>
>
> There are many potential, interesting applications for truly high
> speed data in amateur radio ... the fact that you guys either don't

>
>
Nonsense. That's not where we're coming from at all, at least that's
not where I'm coming from. There is no doubt in my mind that there are
hams who would use high-speed data comms and I have no problem with
that at all. Nor do I have any problems with reasonable setasides for
operation of those modes *IF* they attract a significant user base
wash my mouf.
>
>
One rub comes if those comms interfere in a big way with MY analog
comms one way or another if I don't opt to use some high-speed digital
system operating in a band I use. This fundamental objection to your
postulations has been floating around this NG for years and I have yet
to see you even acknowledge let alone address this concern.
>
>
Another rub being that, based on my observations and some discussions
the interest in truly high-speed data comms via ham radio is close to
zip. Reel back to the early 80s when there were tens of thousands of
286 PC interconnected hams all over the 2m packet system here on the
eastern seaboard as lame and slow as packet was and still is. Along
comes the Internet for the masses and if it wasn't for APRS and the dx
spots nodes 2m packet would be a footnote in the history of ham radio
today. There's the lesson in reality you choose to ignore.
>
>
Networking on the ham bands vs. the Internet has already been
demonstrated as a resounding dud thus the jaundiced posts you attract.
But per previous, go for it, break out the soddering arn and put yer

Ah, but if they're not doing it AS AMATEURS, it's intrusion (even if it's
legal) and therefore a potential interference source.

Bzzzt. Although the ARRL is a lobbying force for hams, it is also a
lobbying force utilized by equip mfrs who would like to have a larger
market. The non-hams out there whittling toothpicks and cursing ham
radio because of the code requirement are not directly represented.
I don't think most of their members as licensed hams are screaming for a
reduction in standards.
Could be wrong. Follow the money...it says Icom/Yaesu/Kenwood/etc.

I don't know that your point of view is accurate. Many here in Dallas were in utter shock for quite a few days after the WTC got hit. In fact, there are people who still get quite "on the edge" at the mere mention of further terrorist attacks. I can't say I was necessarily shocked, as the concept of someone doing that is quite equal to my idea of what mean people can really be like. And it doesn't surprise me at all to hear of people who *are* that mean to do such things.

Wonder if you'd have helped people like myself, Jay? You sound like you were able to come through the whole thing with the same points of view and prejudices you have probably always had? Was it humbling at all to you? I really ask that with all sincerity. I saw a post from you wherein you mentioned not much other than the "trophies" (my term) you kept and, if you were saying that tongue-in-cheek it was not apparent to me. If you'd responded with some explanation of what you were talking about, I certainly didn't see it. I sounded mean, maybe. And you sound mean now, too, I might add.

Whew. Speaking of mean people! How mean *can* you get, Jay? Now you're getting warmed up. Nope, didn't know anyone. At least not that I know of. If you want something, though, my dad told me that he and my mom's best friend's son had some friends and their baby who were on the first plane that went into the building. That help ya out? How 'bout I get my dad to repeater over the repeater and I'll record it this time as his voice crackles? That make ya happy?

>

Yep, sounds pretty mean to me. Well, no credit due here. And, like I said the text where you wrote that you got to keep this and that...well, gave me the impression that's all you really had been impressed with. However, now that you're back to normal and able to start slinging mud, I'm glad I was able to bring you back to your reality, eh?

I would say thanks, but it'd be rather perfunctory of me to do so at this point, don't ya think? Besides, I doubt your prejudiced mind would allow you to believe that maybe I'd mean it...so, we're even. Let's just not either of us go any further with our meanness--we've proven we can get pretty darned mean. But not *that* mean, right? I'll just say: "Welcome home, such as home is."

n2ey@aol.com (N2EY) wrote in message news:<20020202174753.17580.00000783@mb-fy.aol.com>...
> Show us your numbers, Ed. What was the growth per year in the time periods
> before the Tech lost its code test in 1991, after that change,

YEAR AMATEURS DELTA DELTA(%)
1980 393,000 --- ---
1990 467,000 74,000 19% (1980-1990)
2000 682,000 215,000 46% (2000-1990)

While we're at it, consider the number of licensees as a percentage of
the US population:

1980 0.17%
1990 0.19%
2000 0.25%

Clearly, growth spurted after the 1991 no-code license came into
effect. Do you really doubt that, Jim?

> and before and
> after
> the 2000 restructuring?

March 1999 674,719
March 2000 677,784 (1-yr growth: 3,065)
March 2001 684,359 (1-yr growth: 6,575)

After April 15, 2000 the numbers rose at a higher rate than in the
immediately preceding period until they reached their peak in March
2001. Since then they've declined some. That's probably no
coincidence: the decline began just as the first 1991 no-code licences
began to expire. The no-code rules caused a jump in the license
numbers, and it's not surprising to see a matching decline as those
licenses reach their expiration dates. Whether these expirations will
continue to offset growth remains to be seen. It's way too early to
tell for sure.

Caveat: All of this 1-year-term number crunching is pretty tenuous
stuff upon which to draw conclusions. After all we're talking about
sub-1% variations. Those are pretty small potatoes. In the last 12
months, from Jan '01 to Jan '02 the change in the count was zero.
(Yes, exactly zero, according to AH0A.) From Jul '97 to Jul '98
(pre-restructuring) we lost 5,331 licensees. What does that tell us
about the success of restructuring? Not a damn thing.

> I'd go a step farther. Representing code tests as "crippling amateur radio" and

>
> diverting focus from the REAL problems confronting ham radio, like lack of
> publicity, RFI, antenna restrictions, band threats, etc.

Maybe, but I don't think the impact has been very significant. It's not as though those other areas aren't being worked on. And to the degree the no-code debate has diverted attention, aren't those on BOTH sides who allowed themselves to be diverted from more important issues equally to blame?

All Hail, the Darth Vader of Amateur Radio and his 21st
Century manifesto!

This chilling statement reminds me of another from recent
history:

"You may write over the German Army: "The end of the German
Army." For then, gentlemen, you must definitely become
political....You may then become hangmen of the regime and
political commissars, and if you do not behave your wife and
child will be put behind locked doors. And if you still do
not behave, you will be thrown out and perhaps stood up
against a wall ..."

Hi Ed,

Let's see if I get it. The End-Game is that Amateur Radio
will be "transformed" into a technocrat society full of
Bruce Peren's, Carl Stevenson's, Gary Coffman's, Len of 21's
etc, interspersed with their band of followers and
apologists. The rest of us will forced to resign in shame
because we cannot keep up with the cutting edge of the next
digital protocol that IEEE cranks out. What a wonderful
world that will be!

I did not like CW shoved at me, as I could care less to "pound a key" Last time
I checked this was the "new" millenuim. If you want old modes, use them.
String and two paper cups work too, I do not see AT & T using them. At least
some of us will try something new and different.

Yeah, like working to eliminate the requirement that hams learn
an important communications skill at a moderate (13-20 WPM) level.
IOW, dumb hams down so they can get a license and hopefully buy
whatever he's selling at the moment. Fred has his own best interests
at heart, to be sure -- but I don't know where the best interests of
the ARS come into play as far as he's concerned. Moreover, every
personal interaction I've had with him would have completely turned
me off to the hobby, had I not already been involved.

Actually, it would depend if any of those eight years of VE'ing occurred after April 15, 2000. After that date, all he would have to show for his VE efforts are a bunch of paperwork upgrades, and some lazy, technically-uninvolved CB'ers looking for more "lebensraum" on the amateur bands. I just hope he had a fresh roll of Bounty paper towels available to sop up the drool.

Mike:

Glad to see you say that, and I fully agree. How about a sked
on 20-meter PSK-31?

BTW -- I didn't like having CW shoved at me either. I learned it
because I wanted to be a ham. Once I learned it, I grew to love it,
and discovered that it is a very effective mode of communication,
with robust characteristics that I have not found in any other
mode. I started using it exclusively after my last experience
at being cussed out for not knowing my 10-10 number on 10-meter
SSB. Since then, I've been strictly CW and digital modes. Any
idiot can talk into a microphone, and most idiots do.

"Aaron H. Voobner" quoted in part ...

"The FCC's position with respect to RFI to consumer devices is that the consumer device-- telephone, stereo, TV or other appliance--most often is to blame, and that consumers need to deal with appliance manufacturers. Underwood says he's gone the extra mile to resolve interference complaints ... The neighbor's touch lamp seems especially susceptible to RFI and even flickers when he keys his 100-W mobile transmitter while driving by her house, Underwood said. Although he installed some ferrite chokes on the lamp's power cord, the problem persisted. The neighbor has refused further offers of help."

Wrong Mr. Underwood. We, as amateurs, should *never* install anything at anyone's home. Once we do that, we then accept responsibility for further interference (and further cost if it doesn't work). "That guy put something on my TV and now it doesn't work right" We can tell them where to buy ferrite chokes or high pass filters (for example), and can advise them that this might help with the problem, but that is as far as I believe we should go to "help" them. I also find it extremely hard to believe that 100 watts would cause interference to *any* modern appliance (especially mobile) A crock if you ask me. I typically run about 80 watts to a G5RV through a low pass filter and am yet to have *any* complaints from neighbors in the three plus years I have been running my amateur equipment adjacent to them.

I run 100 watts to a G5RV in the apartment building, without a lowpass filter, and have yet to have an interference complaint as well. And yes, the neighbors know I'm a HAM, and they know that if they DO have an interference problem, to drop me a note so we can determine if it's me or something else.

I run in an apartment complex as well up to 150 watts. Chris, touch lamps are notorious and do not make much of a case for much of anything. The only thing I have gotten into is a car stereo of all things; giving it the whumph with SSB or big volume swings with CW was almost fun. Truthfully, I think the owner would have liked to be able to do it himself much like the guy who blew a coupling cap in the amp and invented fuzz guitar.

>here? There isn't anywhere near the level of congestion in the
>vhf/uhf ham bands to justify implementing schemes like that.

Then let us know what your local coordinating body says if you ask to put up a repeater on 2 meters.

If they say no, do you think that the fact that hams are told they cannot do what they want to do on VHF and UHF may be a factor in that lack of congestion.

When we build better roads, more people use them and there are benefits that might never have even been envisioned when the roads were being built.

>One rub comes if those comms interfere in a big way with MY analog
>comms one way or another if I don't opt to use some high-speed digital
>system operating in a band I use. This fundamental objection to your
>postulations has been floating around this NG for years and I have yet
>to see you even acknowledge let alone address this concern.

No amateur operation is free from interference, and I think the best we can expect as new modes are introduced is that the QRM potential is mutually spread around. What percentage of the interference you have experienced on the ham bands has been from others using the same mode you are using, as compared to interference from other modes? And is the inter-mode interference a question of the inability of the modes to mutually exist on the same band, or the same factor that causes intra-mode interference -- inconsiderate operators or changing propagation conditions?

As it applies to spread spectrum, Carl does not need to address the issue of interference to narrow-band modes at all. The FCC took care of that absolutely when it mandated that if a spread spectrum system interferes with a narrow-band user, the obligation is on the spread-spectrum operator to correct the interference.

How much more protection do you think needs to exist than absolute?

What an odd conclusion to draw from my statement that I believe Amateur Radio should contribute some technology to the society that has created it with technology as part of its stated purpose.

If you feel you have not contributed to the purpose of Amateur Radio, perhaps it would be better for you to make such contributions than to resign in shame. If you do not feel you can or want to do so in a techncial manner, there are many other important ways you can be of service.

I have not seen this attitude wrt incandescent bulb users. However, the thread started with Amateur Radio, and the incandescent bulb was an analogy. I have seen people in ham radio say that the technology hams are using is adequate, so there is no need to develop more.

Yes, I do still believe that, although it is clear that in your case, the interest was there to at least learn about it. But you were interested in learning about other things, but probably took the step to set solder to soldering iron and translate that knowledge into hardware.

You did not choose to do that with DSP, although if you didn't understand the concepts, that would be understandable. Perhaps some of the tutorial articles on the ARRL Tech Info Svc DSP page would be useful.

Yep, you got it. Larry's attitude about hating CW and being extremely angry at having had to learn it to join the "higher class" (thought of by Larry in the wrong perspective, of course) is blatantly obvious is his meandering expression of opinions on the subject. I've mentioned that to him, but he's in a state of denial. ;)

Larry,

Where's the smily and the IMHO to your above statement?
In case you missed it, the FCC doesn't consider morse skill
of sufficient importance to still require any 13-20 wpm testing.
Your catagorization of morse as "an important communinication
skill" is simply one person's opinion...yours. Neither you nor
anyone else has been able to convince the FCC that morse IS
important enough to retain 13/20 wpm testing.

Ed,
NCI, like any other group (e.g. ARRL) or individual is free to espouse and
push any position(s) they want. Last I checked, the first amendment
hadn't been repealed. Dick is free to comment, agree,
disagree to his heart's content just as we (NCI) are free
to voice our opinions, beliefs, etc. as well as to counter or ignore
opinions of others. It happens all the time. It's life in a democracy.

Cheers,
Bill K2UNK

Dick probably believes we (NCI), ARRL and the FCC have it
planned that way in some kind of grand conspiracy (IMHO of course :-).

> >Do I want people to upgrade? Just for the sake of them holding a

As I recall, the ONLY paper upgrades were for coded techs who
had been licensed prior to 1987 (i.e. they had taken and passed
the General theory test). In all other cases, anyone desiring
to upgrade required passing a new test or having a CSCE indicating
credit for the required test element having been taken already.

Cheers,
Bill K2UNK

>In case you missed it, the FCC doesn't consider morse skill
>of sufficient importance to still require any 13-20 wpm testing.

Geez, Bill. Are you this placid with ALL forms of authority. (Or just the FCC re. this issue since it suits NCI's "goals"...for now.) I'm a licensed ham but I do NOT hold the FCC up there next to the Pope. They make mistakes too...and plenty of them. Your answer to many (Yes, MANY!) of the comments made on the NG re. the removal of the code is often prefaced by "The FCC doesn't consider..." What about what the majority of licensed amateurs "consider?" And please don't tell me that it's "not about licensed amateurs," because it is. It's OUR hobby/service...both yours , mine, and the future newcomers. If you've convinced yourself that the will of those presently licensed doesn't matter re. this issue, that's fine. But don't expect me to buy that. Let's quit using the FCC as the "righteous" pillar here, they're only the enforcers.

>Your catagorization of morse as "an important communinication
>skill" is simply one person's opinion...yours.

I think you a few hundred thousand souls shy here.

>Neither you nor
>anyone else has been able to convince the FCC that morse IS
>important enough to retain 13/20 wpm testing.

This is entirely correct, but it doesn't say anything toward the validity or correctness of that decision.

All that would be funny if it wasn't a bit pitiful.
All those coordinated repeaters out there, silently using up our spectrum.

The ability of the victim of the interference to actually do something about it
would help. Riley alone can't do it all.
Do I think that Carl Stevenson would be eager to resolve his SS interference to a
"legacy" mode? Do I really need to answer?

Then you clearly have misunderstood what was said. What was rejected is
Stevenson's demand that all hams rush to join the "abandon all the old, flush it
and adopt all the new, posthaste, else
the ARS is doomed" bandwagon.
I'll say it yet again, I KNOW that I have used far more non-legacy technology on
ham radio that he has done. That isn't likely to change, despite his belligerent
puffery. And despite my support and use of CW.

Why do the anticoders always get it all so wrong?

The correct understanding should clearly be "I had to be taught that
Morse code does indeed have communications value applicible to the ARS in
the high-tech age, and so there is ly value in requiring
all hams to be taught the same".

It's the anti-coder - NCI crutch, Bert. If FCC allows/says/does/doesn't do/ it, and it fits hand in glove with their wishes, it can't possibly be in error, whatever the underlying reason for FCC's action/inaction.

Any clear analysis of FCC over the past few decades will show a great many such moves that can easily be seen as wrong, but no matter. They make the rules, even if the rules are destructive rather than constructive. I suppose the total ignoring of CB for so long, and the results of that are the best clear evidence.
And that is not to say that FCC is able, in many cases, to do better, given budget constraints and other negative influences, such as political interference in what was intended to be an nonpolitical process.. Clearly they could do better in some cases, though.

I don't know if there are any 2m pairs open here or not but Philly
being a major metropolitan area I doubt it. Which is why a number of
224 machines have popped up recently. We better start using 222 before
we lose any more of it huh?
>
>
> If they say no, do you think that the fact that hams are told they cannot do

Absolutely not. Do you actually think that there are enough ops out
there who won't get om 2m unless they have their own machines to
affect band utilization? There's a long list of things we can't do, I
can't run FM simplex on 144.050. You think I'm gonna turn my 2m rig
off and go pout and suck my thumb because I "can't do my thing" on
144.050? Ridiculous.

100% conjecture with no supporting data at all one way or another
formal or informal.
>
>
Trunking has been kicked around in this thread and it would accomplish
the sorts of comms you feel are needed. It's an archaic technology and
tbere are a large number of hams who are intimately familiar with it
via their professional activities. I know several. So where's the
trunking from the pros in that game??
>

>
I just don't think there's a market for any of it, it's just a lotta
unrealistic gum-beating and ruminating. Of course I could be wrong . .
you gonna pull a 2m trunking or similar system together and test the
market? Din think so.

I agree Dick, but how much value would be placed in the FCC's thoughts on this matter if they were FOR the retention of the code. They appear to be the "big bully" of the schoolyard. Your feelings for the big bully varies depending on whether or not said bully's taking your lunch money of sharing the booty with you. While I respect "authority," I feel quite comfortable with calling any "democratic" authority that does NOT serve the wants/needs of the majority a "bully."

Dick, since you know my history, (more or less.) you can surmise that this is a sore spot for me. I'd love to see licensing returned to CB as well as the removal of the unenforceable 155.3 mi limit. IMHO, the FCC bungled on both, but perhaps it's more a resource issue wrt enforcement. I've made my mistakes but I've tried my best to apply a cold steak to CB's black eye. This includes working CW on 27.1250 MHz. The majority of my Morse practice was accomplished on a 27 MHz Part 15 QRP device. "Barrier?"...no, not even to a CBer! ;-)

Baloney. In the case of vhf/uhf I have some huge number of normally
unused clear channels available which I can jump on and not have a bit
of QRM from anybody. Do you think for one minute that I'm about to
support giving up some significant number of those freqs just so that
the users of some wide mode are enjoying their excessive bandwidth?
When pigs fly.

The FCC gave plenty of time and opportunity to respond to the rule changes
when they where being proposed. Anyone who sits back and bitches about it,
yet didn't say anything when they had the chance, has no excuse for
complaining now.

Some people, such as Dick, Larry, and Babbling Bruce, don't know how to encourage and build. They only know how to discourage and destroy.

Personal enjoyment does not mean something has overall value. "One man's
junk..." as it were. So don't expect everyone else to appreciate your junk.

Bert,

I believe that the record shows that Bill is correct. And, as the
regulatory agency charged with regulating the spectrum "in the
public interest, convenience, and necessity," the FCC acted on
the body of record in a public proceeding and made its own
determination.

> What about what the majority of licensed amateurs "consider?" And
please don't
> tell me that it's "not about licensed amateurs," because it is. It's
OUR
> hobby/service...both yours , mine, and the future newcomers.

Actually, it's THE PUBLIC's service, and the point is that the
current set of inmates should not be the sole determiners
of how the assylum is run (if you'll excuse my metaphor ...)
The fox guarding the henhouse is virtually always a bad idea.

> If you've
> convinced yourself that the will of those presently licensed doesn't
matter re.
> this issue, that's fine. But don't expect me to buy that. Let's quit
using the
> FCC as the "righteous" pillar here, they're only the enforcers.

They (the FCC) considered the inputs they received from
presently licensed amateurs ... and various other legitimate
factors ... and arrived at a decision. The fact that you and
some others don't agree with the decision doesn't make it
inherently improper or incorrect.

> >Your catagorization of morse as "an important communinication
> >skill" is simply one person's opinion...yours.
>
> I think you a few hundred thousand souls shy here.

I think that the numbers would fall far on the side of
the decision the FCC made, if everyone "voted" ...
however, it still is a matter of establishing sound public
policy, and should NOT be a "popularity contest" thus
a "vote of the incumbent hams" would not be a proper
means of making the decision, even though I'm convinced
that such a vote would go the way I'd like to see it go.

> >Neither you nor
> >anyone else has been able to convince the FCC that morse IS
> >important enough to retain 13/20 wpm testing.
>
> This is entirely correct, but it doesn't say anything toward the
validity or
> correctness of that decision.

It certainly does ... the decision was made on the basis of
a public proceeding, according to the Aministrative Proceedures
Act. As such, as long as the rules were followed, and they were,
the decision is inherently valid.

The fast that you don't think it was the correct decision is
irrelevant to the fact that it was a valid decision, and your
opinion that wasn't the correct decision is just that ... your
opinion. Your opinion and something on the order of a
dollar (more or less, depending on where) will get you a
cup of coffee.

Actually, I've been a licensed amateur for less that one year. At the time of said "bitching" time, I was part of the group that NCI portends to be acting in the best interests of. I was one of those who represent the future of amateur radio. I must've missed the "I won't do anything that requires discipline or work" classes when I decided to become part of the fraternity. When I made the decision, I researched the requirements, sought help when needed, and met said requirements. Odd, it never even occurred to me to ask for a "buy." (Is that how it's spelled? i.e. NCAA tournaments.) So there ya go.

73 de Bert
KC2HMN

P.S. It's actually kinda amusing to be told that one's "bitching" and/or "complaining" by those who support the removal of a 5-wpm code test for some additional privileges. Amusing indeed. 8-D

>
> I think most hams feel the same way.

It may not be "that big of a deal one way or the other" to
some hams who have already "jumped through the hoop"
and "have theirs" ... but it is a big deal to many prospective
hams ... thus, in terms of future growth (even replacing older
hams as they, unfortuantely, go SK ...) it IS a big deal.

> >It is a major leap to go from a belief thatit
> >is time to replace Morse testing with something else to it is
"crippling
> >Amateur Radio."

There's a lot of discussion here about "replacing Morse testing
with something else." Yet NOBODY has ever, that I have seen,
given a rational and compelling reason why something that is
no longer needed NEEDS TO BE (or should be) "replaced by
something else ...

I haven't seen a shred of evidence that the FCC feels that Morse
testing needs to be replaced by something else ... all I saw them
say was that they saw Morse as serving no legitimate regulatory
purpose (beyond the current need to meet the requirements of
the ITU Radio Regulations S25.5 ...).

I see no reason whatsoever that Morse testing needs to be
replaced with ANYTHING ... unless someone has an agenda
to erect additional, unnecessary barriers to entry.

> I'd go a step farther. Representing code tests as "crippling amateur
radio" and
> "digging our heels in the past" does no good. In fact it does lots
of damage by
> diverting focus from the REAL problems confronting ham radio, like

lack of
> publicity, RFI, antenna restrictions, band threats, etc.

I see artifical barriers to entry to otherwise qualified prospective hams as being a "real problem." And one that contributes to bad publicity (many images of ham radio in the media are one of an outdated, Morse-centric activity ...). Additionally, the unnecessary barrier contributes to a lack of numbers (which equal political influence) needed to overturn antenna restrictions, fend off band threats, etc.

That, along with the rift, contention, and class warfare in the amateur community that Morse testing has caused for at least as long as I've been licensed, is what I think Bruce was referring to when he spoke of the Morse issue "crippling amateur radio."

That's all easy to ignore if you keep your head in the sand and take the "it's our (the incumbents') hobby and we should be able to do with it as we please viewpoint.

Huh??? How does an amateur, operating in a LICENSED service,
constitute an "intrusion?"

Also, all Part 15 devices have to accept any interference they
receive from licensed services and cannot cause harmful
interference to licensed services

That's something that all of the manufacturers of 802.11b devices
knew from the start, so the devices and the modulation, coding,
and protocols they use were designed to be robust as the standard
was developed.

In my area there are about 8 repeaters within my reach, and I hate to admit
that the usage of
any of them is rare. I often go up there just to check for any traffic. I
might find one or two
repeaters in use. Down on 2 meters, there can be as many as 8 repeaters in
use at the same
time. Sounds like we need to start using 70 cm much more.

me.

While I am not interested in the details of your "woody" or what
gives you one, and would appreciate it if you'd leave it out of
future correspondence :-), I would submit that once you have
the abiltity to run TCP/IP at sufficient speeds over amateur-
controlled endpoints, you have a platform that's ability to support
applications is virtually limited only by your imagination ...
exchange of files, e-mail, keyboard to keyboard, voice, fax,
web-pages, MPEG-encoded video, access to data, and on
and on and on ...

People say "I don't want to duplicate" the internet ... I would
ask:

1) Why not? ... it's pretty cool ... and to be able to do it without
being tied to wired infrastructure makes it even cooler and
move valuable. Talk about something that would provide
REAL value to the EMS folks ... imagine being able to provide
a decent bridge around outages in internet connectivity for them
during emergencies? Maybe "duplicate it" is a bit strong ...
how about *supplement* it? It's a crying shame that the block
of IP addresses allocated to the ampr.org domain is so poorly
used ...

2) Why limit your imagination to what's available on the internet
now?

What you don't seem to realize is that the "majority" are the citizens
of the United States, not the members of the ARS. The members of the ARS
are less than one percent of voters in the United States. Sounds like
you want a negligible minority of voters to be setting policy.

I don't separate what hams do from the rest of radio. Ed seems to make that
separation, by such phrases as "real radio" and by asking about applicability
outside amateur radio.

As I see it, amateur radio is just as much "real radio" as any other authorized

radio service. What hams do is part of the "radio art".

>2000 682,000 215,000 46% (2000-1990)

Not to be argumentative, but where do your numbers come from, Jon?

I have a a 1984-85 edition of the ARRL Call Directory. Printed early 1984. It says 453,000
total US hams.

Also have a 1993 "winged horse" Callbook. Printed late 1992. Says 575,000 US hams.
>
>While we're at it, consider the number of licensees as a percentage of
>the US population:
>
>1980 0.17%
>1990 0.19%
>2000 0.25%

Sure - but what numbers are you using and what is their source?

How do you compensate for the change from 5 to 10 year licenses, btw? The change occurred in 1984, which means that from 1989 to 1994 there were NO US ham license expirations. Conveniently, most of that falls into the 1990-2000 time frame.
>
>Clearly, growth spurted after the 1991 no-code license came into
>effect. Do you really doubt that, Jim?

Whenever the "price" of something is lowered, there is usually a spurt of "sales". The important question is whether it's a transient effect or a long term change.

I doubt that the 1991 or 2000 changes have/will result in longterm growth changes.
>
>> and before and

>> after
>> the 2000 restructuring?

>(Yes, exactly zero, according to AH0A.) From Jul '97 to Jul '98
>(pre-restructuring) we lost 5,331 licensees. What does that tell us
>about the success of restructuring? Not a damn thing.

Exactly. But we are to believe without challenge claims that code testing
is/was "crippling" amateur radio. Sorry, I don't buy it.

Let's look at some more numbers from AH0A (end-of-month totals):

Total licenses March 00 (eve of restructuring): 677,784
Total licenses January 02 (most recent): 682,602

Increase: 4,918 in 22 months since restructuring

Total licenses May 98 (22 months before March 00): 673,973

Increase: 4,011 in 22 months before restructuring

Not exactly a big difference (917).

How about these (from AH0A):

Total new licenses from March 00 to Dec 01 (sum of all months from
April 00 to Dec 01): 33,856

Total new licenses from July 98 to March 00 (sum of all months for
period of same length before April 00): 27,935

Difference: 5,921 in 21 months
>
>> I'd go a step farther. Representing code tests as "crippling amateur radio"

Cecil, que paso? This about a policy re. licensed US amateurs. Do you think the members of the "Racoon Lodge" would appreciate it if members of the "Water Buffalo Lodge" voted on their referendums. My fictional example concerns Ralph and Fred, but it illustrates a point nonetheless. Amateur radio is open to all those who are willing to meet the requirements set forth. All others need not apply. So the "majority" is rightly those who are licensed of interested in becoming licensed. C'mon Cecil, what gives with the off-the-wall logic tonight. This is really not an altogether complex issue.

Amateurs are required to share the frequencies and have no
expectation of, or right to, exclusive use of any particular
frequency.
That's what the rules say.

However, that doesn't mean that hams should just blast away
without regard for other users ... decent, well-designed digital
systems should detect the energy of other users, at reasonable
levels, in channels the intend to use, and avoid transmitting if
the channel is occupied by another user.

However the same goes for "analog" systems ... in other
words, there is no excuse for the CW operators who key
down intentionally on top of an ongoing digital mode QSO.

dx
> spots nodes 2m packet would be a footnote in the history of ham
radio
> today. There's the lesson in reality you choose to ignore.

No ... I think that the lesson in reality is that amateur packet
didn't
keep up with the level of "service" (data transfer rates, and other
preformance metrics) that the internet provided, thus it became

VERY boring by comparison ... had hams kept their technology
competitive in performance, I see no reason why there would
have been such an exodus as there was ...

> Networking on the ham bands vs. the Internet has already been
> demonstrated as a resounding dud thus the jaundiced posts you
> attract.

Yes, "networking" at 1200 or even 9600 baud is a dud ... I won't
dispute that ... that's why, when someone floated a "Request
for comment on a new TNC design" (at 4800 bps) I asked "Why
would anyone want to waste their time on such a project???"

What you don't understand is that the citizens who do not apply have
just as much right to try to influence ARS policy as a licensed ham does.
It would be unconstitutional to allow members of the ARS to run the ARS.
Responses to the R&O are open to all citizens.

That's why the FCC runs the ARS. They have the other 99.5% of the voters
to consider in their decisions. They are supposed to run the ARS based
on what is *good for the country*, not upon what is good for individual
members of the ARS. The FCC has decided that a 5wpm Morse code exam is
presently *good for the country*.

Now this is actually an interesting question. Perhaps we can play a little game (For amusement only.) since you seem to be in a "semantic" mood this evening.

Should Juan's vote count any less that John's despite the fact that John was born in the USA 50 yrs. ago and Juan was naturalized last year?

None of us are born amateur radio operators, we all had to put forth some effort to get from the street to the starting line. (Remember, there is no finish line.) Those before us set the standard, for better or worse. The only thing that was really "required" of us was to want it enough to "meet the current requirements." In doing so, we became part of the faculty who gets to set the standard for the next "freshman class." I was lucky enough to hook-up with some folks who set me on the right path. They made it plain and I brought the work-ethic. I told them what I wanted, I was in-turn advised of what I needed to do, and I did it. Overall, a very satisfying and rewarding experience. The anti-code folks might have a point if they needed 20-wpm for HF privies, but 5-wpm? C'mon Cecil.

voice
> mode that can replace SSB. (Carl?)

I can envision several ... depending on exactly what your
goals are ...

There are coding schemes available that are
"near toll quality" at data rates as low as 2400 bps ...
lets say we use QPSK ... pretty narrow bandwidth and
good Eb/No performance ... you could even add some
redundancy for FEC and still have something that's
comparable in bandwidth to SSB ... with some interleaving
over FEC codewords, it could work pretty well.

Another approach is to use a multitone modem and lower
symbol rates ... with some parallelism in the data being
sent on subcarriers dispersed enough in frequency to
provide some protection against selective fading.
Again, FEC and interleaving, properly applied could
provide benefits as well.

There are other possiblitilies as well, but two examples
ought to be enough to make a point.

The "labor of love" concept has no place in a governmental requirement.
The test is about qualifications, not about love. The FCC has decided
that a 5wpm Morse code exam is a sufficient qualification presently.
If S25.5 is repealed, the FCC will have to decide if an amateur
radio operator is qualified without Morse code.

As an illustration: If a military special forces person who already
can do 40wpm Morse code decides to get his General ham license, he
must pass the 5wpm exam. A "labor of love" would have him passing
a 50wpm exam. "Labors of love" should be reserved for things like
frat initiations, not governmental requirements.

I'm perfectly satisfied with the present requirements, Bert. My
satisfaction and two bucks will get me a decent cup of coffee.
The question is: Will the FCC be satisfied with the present
requirements when and if S25.5 is repealed?

So that's all it's about, "governmental requirements?" If I believed that, I'd be really disappointed...but I don't so I'm not. :-)

There's a deep tradition and fraternal spirit in amateur radio. While it may become frayed and somewhat tattered, it's yet to be torn. Morse proficiency, howebver minimal, is but one thread of that spirit. You probably believe that it's only about the radio. Maybe that fresh "1-year" perspective is needed more that first thought.

Socrates is considered the father of democracy. He promoted democracy
above all other systems. It is somewhat of a myth that the democracy
voted for him to drink hemlock, a deadly poison from the hemlock plant.
Thus his "democracy" was responsible for his death. (He was accused of not
properly promoting the Morse Code Creed of the time and sentenced to death. :-)

That's true, but the FCC doesn't care a whit about tradition or fraternal spirit and that is as it should be. It is up to the members of the ARS to promote the traditions and fraternal spirit. CW will survive because it has merit, not because the FCC should be dedicated to preserving an outdated mode. There is room in the ARS for both the old and the new. The choice of embracing the old or the new or both should lie with the individual ham who should not be hamstrung by governmental requirements. An individual just cannot be forced to like something. Hams are no exception.

It's the broad picture. The members of the ARS don't own the ham bands.
The citizens of the USA own the public property that is the ham bands.
The FCC is supposed to act in a manner that is good for *all* citizens,
not just members of the ARS. The ARS is open to all *qualified* citizens.
The FCC gets to decide what "qualified" really means. Does CW skill
make a better ham? Of course it does. But should minimum requirements
include Morse code skill? The jury is still out.

too...and
> plenty of them.

In the sphere of influence that the FCC rides heard over,
the FCC is above the Pope. Like it or not, it is the FCC
and only the FCC that gets to make the rules we amateurs
live by in the USA. The issue of value, importance, etc of
any one mode as to the role any skill in that mode should
be a requirement absolutely IS the FCC's to decide.

> Your answer to many (Yes, MANY!) of the comments made on the NG
> re. the removal of the code is often prefaced by "The FCC doesn't
consider..."

PLEASE tell me what is inaccurate in that statement.

> What about what the majority of licensed amateurs "consider?"

The opinions of the majority, minority of licensed amateurs
is simply that...their opinions. Those opinions and considerations
are free to be shared or otherwise submitted to the FCC at any time.
Indeed, the FCC expressly offers everyone, both ham and non-ham alike,
the opportunity to submit their thoughts, opinions, suggestions
on FCC rules every time they (FCC) open an NPRM.

> And please don't
> tell me that it's "not about licensed amateurs," because it is. It's OUR
> hobby/service...both yours , mine, and the future newcomers. If you've
> convinced yourself that the will of those presently licensed doesn't
matter re.

The "will" of those presently licensed is, as stated
before, only subject to consideration by the FCC at the discretion
of the FCC.

> this issue, that's fine. But don't expect me to buy that. Let's quit using
the

> FCC as the "righteous" pillar here, they're only the enforcers.

Who then, if not the FCC gets to make the rules that you claim
"they're only the enforcers" of?

> >Your catagorization of morse as "an important communinication
> >skill" is simply one person's opinion...yours.
>
> I think you a few hundred thousand souls shy here.

Isn't it odd that there weren't anywhere near "a few hundred
thousand souls" that submitted comments/opinions/or otherwise to
the FCC when the FCC specifically asked for any such input?

> >Neither you nor
> >anyone else has been able to convince the FCC that morse IS
> >important enough to retain 13/20 wpm testing.
>
> This is entirely correct, but it doesn't say anything toward the validity
or
> correctness of that decision.

It absolutely does in the only context that makes any difference.
IF the FCC doesn't accept the validity of a particular argument,
it becomes immaterial as to who else outside the FCC might
think otherwise.

The FCC doesn't consider rules changes for ANY service based
on any majority. That is the reality of the regulations authority
expressly given to the FCC in the US government.

As to the opinions of a majority of hams, that isn't even known,
nor could it likly be established in any case.

In the area of government rules/regs, it is not a subset of the public
that gets to serve as a "majority." Does the driving public (i.e.
licensed drivers) have exclusive control, input, opinion regarding
the rules that apply to driving a motor vehicle?

> >--
> >cheers, CAM
>
> Thats Exactly what NCI wants

Absolutly FALSE unless you consider the FCC to be that
"negligible minority." The fact remains that the FCC does
get to make all the rules and we (NCI) simply recognize it is
primarily the FCC that we (NCI) must convince as to any
rules changes we might want.

On a parrallel note, it is my understanding that a majority
of motorcyclists would just as soon do away with mandatory
helmeit laws....yet that majority doesn't hold sway with the
legislative bodies in most states to end such helmit laws.

In many cases, rules that are not popular with a majority
of people impacted are brought about by small, dedicated groups
of people.

Cheers,
Bill K2UNK

Bert,
The role of government requirements, set by the FCC, absolutely
is ALL it's about as to code testing as a requirement. Issues and opinions
regarding effort, work, "love", etc. are not and should not be any
aspect of governmental licensing.

> There's a deep tradition and fraternal spirit in amateur radio. While it
may
> become frayed and somewhat tattered, it's yet to be torn.

And nothing in the rules, regs or requirements can or should be
a requirement as a consideration of such tradition or fraternal spirit.

> Morse proficiency,
> howebver minimal, is but one thread of that spirit.

Once again, tradition and spirit are NOT appropriate aspects
of government requirements for licensing.

Agreed.

> Those before us set the standard, for better or worse.

What standard? If you mean the test requirements, they have been
set by the FCC for over 50 years...not by licensed amateurs.

> The only
> thing that was really "required" of us was to want it enough to "meet the
> current requirements."

Agreed.

> In doing so, we became part of the faculty who gets to
> set the standard for the next "freshman class."

I'm still missing what that standard is...where is it identified?
If it is the overall attitude, perspective and commitment that
hams make towards various aspects of the service, then I'd suggest
that any "standard" is anything BUT a standard as ham radio
has always embraced a wide spectrum of acceptable behavior,
participation and/or commitment from licensed hams.

> needed to do, and I did it.

If by "what was required" you refer to specific test requirements, I
absolutely agree.

> Overall, a very satisfying and rewarding experience.

Good, glad you enjoyed it.

> The anti-code folks might have a point if they needed 20-wpm for HF
> privies, but 5-wpm? C'mon Cecil.

The issue is NOT the degree of effort needed, it is the merit
of the requirement itself. THAT is the issue. If you are saying
the 5 wpm should be retained because it isn't (in your oopinion)
a significant effort for most people, then I disagree and have stated
such at many times in this forum as well as in my filed comments
with the FCC some three years ago.

Additionally, I learned a long time ago to work within the system
rather than confront it head on. Those that take the "headon"
approach usually end up getting the shaft ialong the way. Reminds
me of many in the military service who thought they could take on
the "system" and paid for it in the end...rather than simply accepting
the system and working it as best theycould until their enlistment or
2 years draft service was up.

>
> 73 de Bert
> KC2HMN

Bert,

Apparenty it's too complex an issue for YOU to fathom ...

The Amateur Radio Service and its use of spectrum (which belongs
to all of the population ... not to hams ... we're just allowed to USE
part of it ... we don't own it ... READ YOUR LICENSE) is NOT
the "Racoon Lodge." It is NOT a private fraternity that is largely
free, within some limits, to set its own rules.

The whole issue is about the legitimate requirements to GET
a license. That is not a matter to be decided by a popularity
contest amongst incumbent licensees. The fox may NOT
guard the henhouse ...

Yes, amateur radio is open to all who meet the requirements
set forth ... but YOU don't get to determine those requirements.
THAT's the FCC's job ...

Your "others need not apply" (unless they do it your way)
is a stinking pile of crap.

And you base that view entirely on the fact that we support a code test for hams. So all that means anything according to you anticoders is the sole factor of Morse code. That clearly shows your mentality, and it is disgusting.

Funny ... I also don't see "fraternity" in there anywhere,
either.

Nor have I been able to find the section where it says,
"The current brothers of the fraternity shall determine
the nature and extend of hazing rituals which must be
endured by pledges wishing to become members of
the fraternity."

That's what Bert is asking for ... he has the ARS
confused with some stupid college fraternity and
thinks that he and "the brothers" ought to get to
set whatever arbitrary hazing rituals suit their whim.

That's REALLY a pile ... Bert, and quite a few
others here who obviously feel the same way,
just don't seem to have a clue as to how sound
public policy is formulated or how the rights of
individuals are protected from the tyrany of
some self-appointed "ruling class."

Thomas Jefferson said: "The government that
governs least governs best." Don't take my
word for that ... go visit his tomb .. its engraved
in stone on the walls in HUGE block letters so that
even twits like Bert might stand a chance of being
able to read it.

You see what isn't really there, Carl.

There has been a US nocodetest ham license that gives ALL amateur
radio privileges above 30 MHz for over a decade now. Has it resulted
in new technologies? Unprecedented growth? Nope.
>
>That's all easy to ignore if you keep your head in the sand and

If folks are unhappy with the requirements they could comment to
FCC NPRMs. The vast majority of those who do so are hams,
not nonhams.

Sounds to me like you would rather have amateur radio's future
decided by a small group that happens to agree with you rather
than by the majority of those in the amateur radio community.

Hi Cecil,

Trouble is, those carpet baggers from Newington have convinced everyone that they are the representative national organization, "of, by, and for the radio amateur". Also, they are striving to emass a large lobbying war chest (even though their by-laws prohibit such). And we all know that we have the best congress critters money can buy!

If dealing with those NCI butt-boys wasn't bad enough, we have to face an FCC that is enamoured with every crackpot claim of the digital mode de jour crowd that comes down the pike, and whose idea of good spectrum management is selling it off to the highest bidder. Do you ever wonder about the parade of digital wireless service companies headed toward or just about to enter bankruptcy as of late, eg. Motorola, Lucent, ATT Wireless, Global Crossings, etc.? I figure the FCC is just about as competent with recognizing and promoting good technology as the FAA has been in recognizing and promoting good airport security.

73,
Clay N4AOX

SO why you choose to just ignore what the FCC says when it suits you, and other times swear the are always right? FCC has repetedly stated that they want hams to form a "concensus" of what we want
done in the area of regulations. Of course, when some special interest group such as you and NCI gets to certain key personnel, and gains sympathy for their point, they can change their own procedures at will.

Of course not ... but this is really not a good analogy. We're not
talking about voting rights ... it's more like the right of free
speech.
Even non-citizens have a right of free speech.

Of maybe "freedom of religion" ... no religious group has the
power to dictate the religious beliefs and practices of any
other in this country ... try to view modes as analogous to
religious practices (sometimes I think some Morse practitioners
DO view it as a true religion ... and think it should be the State
Religion, despite the fact that the Constitution prohibits that.)

> None of us are born amateur radio operators, we all had to put forth
some

is no
> finish line.) Those before us set the standard, for better or worse.

"Those (licensed operators) before" you did NOT set the
standard for your entry into ham radio ... its the government
in the form of the FCC that sets the standards for ham licensing..
(When are you going to get that through your head?)

>The only
> thing that was really "required" of us was to want it enough to

"meet the
> current requirements."

That's true ... but the requirements have changed to fit the times.
Learn to live with it.

> In doing so, we became part of the faculty who gets to
> set the standard for the next "freshman class."

You're joking, of course .. a 1 year ham is a member of
"the faculty that gets to set the standard" for those to come?
I think you're suffering from delusions of grandeur or
something ...

> I was lucky enough to hook-up
> with some folks who set me on the right path.

If you're really dumb enough to believe that FCC has not always understood the relationship of the rich history, trdition and spirit of the hobby as crucial to our selfpolicing and used that knowledge to formulate our rules, you are far more ignorant than I ever realized, and frankly I knew it was bad already.

Yep, I understand more than you can know, Bert. Over the past 30 years I have assisted many CBers in becoming hams, and many made darn good ones. A few did not, and reverted to their former pursuits, but recividism is a factor in any such situation. The problems never was CB itself, but the rascals who ruined it.

Cecil .. I stand by my previous comment above.

Hoever, to satisfy your curiosity, I used to be able to do
about 60 wpm or so (typing), but a spinal chord injury
at C5-C6 left me with some loss of coordination and
sensation on my hands ... now I can only do something
on the order of 30-35 and that's not always completely
error-free.

> done in the area of regulations.

The FCC made that statement years ago. So what? In
asking or wanting a consensus, the FCC never ruled out
other possibilities nor did they mandate NCI nor anyone else
from taking action through other legal means. Bottom line,
the call for a "consensus" was NOT a ruling or regulation.

Regardless of that point...
since then, the FCC has (IMHO) abondoned that "consensus"
mindset. Indeed, the R&O for NPRM 98-143 seems to simply
state that the ONLY reason to retain any code test at all is the
international treaty.

The point that you and a few others just don't get is that
the FCC makes the rules. The FCC is THE entity that
must be convinced to gain any change in regulations.
While the FCC did, at one time, suggest they wouldn't
entertain any code test requirements until there was a
"consensus", it seems they (FCC) abondoned that mindset
when they opened NPRM 98-143.

Serious question...
Assuming the FCC still wanted a consensus...
just how would YOU suggest any consensus might be
reached in any case?

>Of course, when some special interest group
> such as you and NCI gets to certain key personnel,
> and gains sympathy for their point,
> they can change their own procedures at will.

Are you suggesting that I and/or anyone else in NCI did
anything illegal? Immoral? Unethical?

As to myself and Carl making a personal visit to the FCC
to make the NCI case...that is an "ex parte presentation" and it
is totally legal, ethical, and that ex parte presentation
is a matter of public record in the FCC.

The more interesting thing to me is (IMHO) that many of
those that oppose the efforts of NCI simply underestimated
the dedication, commitment and ability of NCI to facilitate
and work within the "system" to make the NCI position
a key input to the FCC decision process. NCI officials
learned the rules of the game and worked within those rules.
That seems to "tickoff" people that didn't (IMHO :-).

Cheers,
Bill K2UNK

Jim,

If amateurs' state is at least several generations of technology
"behind the curve", relative to what Ed and I have refered to as
"real radio," where is the value? How are amateurs "advancing
the radio art" if they're so far behind the rest of the radio world?

THAT's one of the points I've been trying to make ...

Your statement is sort of like saying that by becoming a good
horseman one is "advancing the state of the art of transportation."

I think so, too, Jerry. I don't think I'd feel right using the justification that 70cm is one of the most popular of the amateur service allocations. It seems that is not the case in this area, anyway. I listened (had radio turned up scanning) most of this weekend on the 70cm band. Except for 444.150 (a local IRLP repeater), there was nothing worth mentioning. I think the best justification I could give for it here is crossband repeating in emergencies, and I'll think of some other stuff.

Yep, we need to use it...or we're going to lose it.

For what I thought was going on, it doesn't/didn't much matter what he was doing, Jim, or where. It sounded to me like "Jay" (isn't Jay really Steven?) was impressed with the gimmees. While it's a fact of life that most people won't do something without getting something for it, I would hope it's not the primary motivation--as that post sounded. Whether it was meant to sound tongue-in-cheek, it did not come through that way to me.

Yeah, while I think it's cute that Hans said anyone who spends more than 10 minutes in this newsgroup needs to get a life--all the while as he is formulating presentation as above, I don't know what the point of it is. And, I don't know why he listed me twice instead of combining the results. Maybe Hans was 10th? LOL

What part of "not" above did you not understand? If the amateur is NOT operating such a device NOT as an amateur, there is no licensed service involved.

>Also, all Part 15 devices have to accept any interference they
>receive from licensed services and cannot cause harmful
>interference to licensed services

Nice regulation. Try putting that in practice. Tell your neighbor that he can't use his 2.4Ghz cordless phone because it jams your lan (operating under the amateur rules in excess of part 15 - legally) and see how far it gets you. The lan equipment may have some immunity, but not ATV and conventional narrow band modes usually used for voice.

Or at minimum, a local area bandplan change recognized by either the local amateur radio frequency coordinator group or a majority of amateurs of the area involved.

On this point, I agree: If an amateur wireless network does use the same set of protocols (it doesn't have to be TCP/IP, but in this case, it is) as the wireline communications infrastructure, then in a disaster where the wireline infrastructure fails or is destroyed, it's alot easier for the amateur community to step in and provide emergency communications "relief" (to the extent that the rules provide) than it is for a completely heterogeneous system with no protocol in common outside of the amateur community.

>2) Why limit your imagination to what's available on the internet
>now?

What limit? I wasn't aware that the Internet had any limits whatsoever. New things get added every day.

First let me say this. I am me and not any other person(s) that Len
thinks I am. What he thinks is becoming increasingly important only to
him. His type of antagonist is the prime reason I post behind anonymous
addresses. His type is the cyber-stalker that we read more and more
each day. His type is, well, very scary.

Anyway, I read his post were he accuses he of being someone I am not.
Since I like this sort of challenge, I went to QRZ.com, looked up the
callsign in question and sent off an e-mail along with a copy of Len's
post to my alleged other self. About 45 minutes later, I received what

can only be viewed as a novelette. 4 pages of pure unadulterated dislike bordering on what can only be construed as hate. KF2TI went on and on about the EVIL DOER, Leonard Anderson, Len's fascination with the 3rd Reich and Len's insistence that every anonymous poster is him. He left his phone number with the comment "we can have some real fun with the geezer, if you're interested, give me a call"

I called and what he proposed was that we are going to test Len's ability as the defective detective of RRAP. When the next post came through involving me, I would call KF2TI and send him an e-mail with verbiage, he would post it and wait till it appeared in my ISP's newsgroups and then I would respond. So to Len, it would appear I am responding to myself through both "screen names" thus allowing Len the exacting pleasure of posting his findings to the group, thus proving him right and me wrong.

This all took place with Kim's post and from start to finish, took less than 10 minutes. I e-mailed the words, KF2TI posted, about 4-5 minutes later it appeared on my earthlink news and I immediately responded.

The headers are all there for all to see and yes, there is a commonality, which in the scheme of things means nothing. There is 1 difference that proves categorically, Len doesn't know his ass from a whole in the ground. It's there, see for yourselves. Better yet, have Len explain his comments, I doubt he could to anyones satisfaction.

In closing, the one comment, actually there were quite a few, that caught my eyes in KF2TI's diatribe against Len was"I was hoping that 2001 would be the year he disappears permanently, hopefully 2002 will be the year someone drops a house on him like they did to his sister, the wicked witch of the east". I guess the 2 of them are less than close?

73, Jay from Westchester County, NY FN30cw

Still me at least that what it says on the name tags in my shorts ;-)

Well, two out of the three mentioned above have said they would rather
see the ham frequencies taken over by commercial interests than have
a nocode ARS. If that's not discouraging and destructive, what is it?

The huge flaw in your argument is the almost zero number of non-hams who ever comment on ham radio rulemaking proposals. Usually those who do are commercial interests.

No more than what will result anyway. When the tests are so trivial that any Freebander who wants can climb on board with the full load of privileges at will, it's only a matter of time till selfdestruct occurs.

Of course you lie again, as usual. That's not what was said.

Kim:

I see. You get something totally wrong, I disagree with you and
correct you, and then you claim that *I* am in denial? Well, if it
makes you feel better to think that, Kim, then go right ahead...but
you're nobody who can judge my state of mind on any issue.

Kim is in a virtual 4th place, and I'll bet she posted fewer words than
anyone else in the top 10! That's what happens when your typical
response is "ROFLMAO" or a one-liner agreeing with something
someone else has said. In other words, nothing of any substance!

I'd like to see some stats on volume of text (in words or kilobytes)
posted by all users over the past ten years.

Bill:

Yup -- it's Fred's personal problem, to be sure! I'll never forget the
way Nancy Kott, WZ8C, cleaned his clock at Dayton '97. If she
only had the vision to make FISTS into something other than a
club for CW ops to earn meaningless awards, Restructuring may
have gone quite differently.

Bill:

Anyone who wanted to become a ham for the right reasons would
never be discouraged by my opinions. If I have discouraged anyone,
it is mainly those who who are merely seeking refuge from 11 meters,
and have no interest in the true amateur radio experience. I'm sick
and tired of meeting "newcomer" hams who know absolutely nothing
about even the basics of electricity, yet alone have a clue about
how a radio works. I know that ham radio is a learning experience,
but all the hams I knew when I came in already knew the basics
as a result of personal study, experimenting as a general electronics
hobbyist, and SWL'ing. None of that happens anymore. People see
hams talking into a microphone without paying airtime charges, and
they want in on the same -- right now -- without paying any "dues"
as far as learning is concerned. They need to be hand-held through
even the most rudimentary basic operation of their off-the-shelf
appliances, mainly because they can't be bothered to even read
the "Quick Start" instructions. Then they justify their existence by
making a big deal out of carrying an HT at a Walk-A-Thon, and
making it sound like they're FDNY-class heroes while doing so.

The only people who would be discouraged by my opinions aren't
worth having in this hobby/service. Anyone with a true curiosity
about the technical and operating aspects of ham radio will have the
initiative and ingenuity to pursue it, without worrying about the

fact that people like Dick, Dave, and myself are able to express our opinion that ham radio is being dumbed-down into irrelevance.

You go ahead and continue to be as politically-correct as you want. I'm sure it will make you popular with the HT-slinging kerchunkers who don't know which end of the soldering iron gets hot. After all, they have "Elmers" like you to do their soldering, and their thinking, for them.

So tell us again why FCC would be very interested in the opinions of anyone who had never had any involvment in ham radio, particularly who never had enough interest to begin the licensing process. They should listen to those folks for advice over hams of long experience? Right, Bill, just as right as you always are.

Not entirely true.

Coordinated repeater pairs have precedence over other users. If you
don't believe me, check FCC enforcement letters. Same for operation
in conformity with bandplans vs. not in conformity.

This is the same FCC that is frequently quoted by some for their statements
about code testing.
>
>However, that doesn't mean that hams should just blast away

Sounds nice but it doesn't necessarily work that way. If the digital
system cannot hear all users on a given frequency it will think the frequency
is not in use.
>
>However the same goes for "analog" systems ... in other

No, there isn't any excuse. Do you have any real-world examples of
where that has happened to you? What digital modes did you use
to work those 70 countries on HF?

And what about the digital or SSB system that chews up the CW QSO?
Happens all the time.

Amazing. Now you can somehow know the motivations of all of these people you never met. On what basis do you know that all fo those who want to come to ham radio from 11 meters have no interest in the "true" amateur experience, but all of those others do have such an interest, so will not read the bitter, spiteful things you say and believe that the welcome they might receive in ham radio will not be a warm one.

Had I run across someone like you when I was first being interested in ham radio, he would have dampened my 13-year old enthusiasm pretty quickly. Those that are more productive in their approach to ham radio may have helped me understand that not all hams were that way.

You may be right, Larry, that not many newcomers will be discouraged by the things you say, but if so, that is only because someone else is undoing the damage behind you.

>I know that ham radio is a learning experience,

>Nice regulation. Try putting that in practice. Tell your neighbor that he
>can't use his 2.4Ghz cordless phone because it jams your lan (operating under
>the amateur rules in excess of part 15 - legally) and see how far it gets
>you.

What did your neighbor say when his cordless telephone interfered with the
spread-spectrum LAN you put up under Part 97?

So far, I don't think I have more than a handful, and a small handful at that,
of reports on harmful interference to Amateur operation from intentional
emitters on Part 15.

>FCC?

He might be. Let's ask him. That will certainly be a better answer than any
speculation you or I could offer.

Carl, do you have any intention of petitioning the FCC to secure exclusive
spectrum for amateur spread-spectrum devices in which "legacy" modes would not
be permitted?

>>That would require a rules change.

>Or at minimum, a local area bandplan change recognized by either the local
>amateur radio frequency coordinator group or a majority of amateurs of the
>area
>involved.

That is incorrect. It would require a rules change. The present amateur rules on spread-spectrum require that a spread-spectrum operator not cause harmful interference to other users. On frequencies where SS is permitted, voice, data and CW are legal on all frequencies. The FCC has specifically declined to issue a declaratory ruling that operating outside of the band plan is a defacto "good amateur practice" rules violation.

>I can envision several ... depending on exactly what your
>goals are ...

It would be interesting to see how those modes hold up vs SSB under noisy, fading conditions with fast ionospheric changes resulting in sudden phase shifts in the received signal. In many cases, a skilled SSB op can pull intelligence out of a signal that is barely audibile. My guess is that most of the digital voice modes in commercial use today require several dB of noise margin. IMHO, SSB may be the optimum voice mode under those circumstances, although I welcome any pointers to info to the contrary.

Of course, it is possible that amateur experimentation with such modes could lead to improvements.

The converse it equally true, Carl. Try calling CQ on CW in the "digital" part of 40 meters and report the results. :-)

> had hams kept their technology
>competitive in performance, I see no reason why there would
>have been such an exodus as there was ...

I am not sure hams could have kept up the intereconnectivity of the Internet, Carl. Building a parallel structure at T1+ rates would be the impossible dream, IMHO. And without that interconnectivity, blazing speed would not be enough.

And content rules would certainly be a problem, too. As an example, there are "hobbyists" building inter-city networks in a number of major cities, using 2.4 GHz Part 15 equipment. The primary purpose of this, however, it to obtain free internet service. If all those guys could do with their Part 15 network was to connect to each other, I don't think they would do it.
This could be all be done under Amateur Radio, but I think that the content of many web sites that one might connect to would be outside the scope of Part 15.

It is ironic, though, that the groups of hobbyists and experimenters doing significant work with Part 15 devices are doing so outside the scope of Amateur Radio.

>Coordinated repeater pairs have precedence over other users. If you
>don't believe me, check FCC enforcement letters.

Absolutely correct.

>Same for operation
>in conformity with bandplans vs. not in conformity.

Maybe. While Riley has sent a few "advisory" letters for operation outside the band plan, in the past, the FCC has specifically decided NOT to issue a declaratory ruling that operating outside the band plans constituted poor amateur practice and a rules violation.

>This is the same FCC that is frequently quoted by some for their statements
>about code testing.

A statement in a Report and Order has more legal standing than a letter from Riley asking someone to stop being a jerk.

>Sounds nice but it doesn't necessarily work that way. If the digital
>system cannot hear all users on a given frequency it will think the frequency
>is not in use.

Most of the digital systems that will be put into place on the ham bands will run 1 watt or less power. That will put them at a distinct disadvantage wrt narrowband users, most of whom will run more than 1 watt of power.

That is not to say that interference will not happen, but the present rules do not prevent interference from happening between narrow-band users, either. All of the interference from Amateur operation I have experinced in 35 years of hamming has been from other narrowband users.

>When I fire up this lame-o AOL dialup connection, I get access to all
>sorts of stuff - weather, news, stock quotes, websites like eBay, and a
>bazillion other things. Most of which is forbidden on the ham bands.

I think the pizza rule would allow you to use Amateur Radio to access the sites you mentioned, as long as you did not do so for business purposes. It the www.hotbabe.com sites that I think would most easily run afoul of the rules.

Of course, I don't get access to any of those sites on CW, either, but I still enjoy and use the mode. :-)

>If amateurs' state is at least several generations of technology
>"behind the curve", relative to what Ed and I have refered to as
>"real radio," where is the value? How are amateurs "advancing
>the radio art" if they're so far behind the rest of the radio world?

I understand the point that Jim is making, and I agree that my use of "real" radio was inappropriate and misleading. Some of the value of Amateur Radio is IN its simplicity, and the fact that modest stations exists throughout the country has value. Seeing as our FCC knows the nature of the Amateur Radio Service and continues to authorize it makes our service, just as it is, an important part of radio.

That doesn't mean, however, that the point you have made -- and that the FCC has repeatedly made -- that the technical contributions of the Amateur Radio Service are an important part of what justifies our existence is not also true.

And with the majority of amateur operation being behind the technological times, Amateur Radio is not making as much contribution as it could. Hard to say where the line is best drawn, Carl, because there is value in so much of Amateur operation, from the OOK CW op to those developing spread-spectrum systems.

I think part of our "disagreement" here is that, both real and imagined, those whose personal interests are on one direction tend to demean the other interests, or trivialize them, or at least be seen as doing so. I didn't intend to do that at all, although I see that my choice of words could easily be seen as doing that.

One of the finest things about Amateur Radio is that we are each free to choose our path and make that part of Amateur Radio better.

>Your statement is sort of like saying that by becoming a good
>horseman one is "advancing the state of the art of transportation."

Walking is very much a part of our national transportation infrastructure, Carl. The governments of the world build sidewalks for darn good reason.

> sat on your butt bitching how "unfair" life was for over a quarter
> century.

I interpret "met the requirements for almost all HF access" to
imply that Bert has a General class license. If he started
a year ago, he had to pass 5 wpm, plus the written elements
through general to get there.

I passed that same 5 wpm and the full general 25 years ago,
yet didn't get the HF access because of the backwardness
of the rules until recently.

So, it would appear that, in terms of passing equivalent test
elements, I was where Bert is now 25 years ago ... but the
system didn't allow me the same privs that Bert enjoys ...so:

1) Why do you hold Bert up as somehow being "superior" ???

2) Given the situation, I think some bitching (in favor of
change) was reasonable.

However, please note that I am not complaining that Bert
earned something under the new rules. I don't consider
Bert's privs a "giveaway" ... but your comments always
seem to indicate that you think that MY new privs ARE
in some way a "giveaway" ... despite the fact that both
Bert and I have met all of the prescibed requirements

under the rules.

Given that, can you explain rationally (I don't think so)
"Why are Bert's privileges "earned" and mine constitute
some form of "giveway?"

> Clueless to a fault.

Yes, you are, Dick ... the fact that you were unable to reason
out the point I just made above seems to provide yet another
proof of that fact.

Nowadays, it learns a can too filthy beneath her good spring. Lately Chester will depart the exit, and if Eve familiarly receives it too, the pen will dine behind the heavy stable. The drapers, ulcers, and carpenters are all proud and fresh.

Valerie grasps the shopkeeper under hers and firmly cleans. Where will we walk after Nell nibbles the pretty hill's tailor? Jonathan teases, then Woodrow regularly creeps a stale counter under Lionel's night. Hardly any grocers will be wet strange painters. If you will shout Henry's plain before balls, it will steadily change the pickle. Calvin, in front of gardners glad and worthwhile, recollects for it, attacking fully. She wants to pull bizarre lentils inside Priscilla's hallway. Just irrigating alongside a pin within the sign is too sick for Jethro to help it.

I was sowing to pour you some of my humble buckets.

Get your freely wasting bush near my fire.

For Ronald the disk's old, at me it's wide, whereas for you it's combing clean. It's very lean today, I'll explain smartly or Dick will improve the tapes. While printers wanly cover pears, the powders often solve beside the bad jugs. Where does Lloyd excuse so stupidly, whenever Laura fills the long game very grudgingly? Some units smell, judge, and scold. Others eerily attempt. Plenty of bandages bimonthly believe the pathetic canyon.

Her butcher was angry, dull, and irritates near the mirror. Both looking now, Priscilla and Aloysius kicked the ugly ladders for sharp shirt. Try laughing the arena's light envelope and Angelo will love you! Carol, have a easy goldsmith. You won't expect it. He should will slowly care in Rickie when the inner pitchers dye outside the poor window. Are you cosmetic, I mean, answering in tired books? If you'll kill James's highway with raindrops, it'll eventually live the frog. I arrive fat cards in the solid sour office, whilst Wayne superbly cooks them too.

One more unique codes are thin and other weird cars are abysmal, but will Dave behave that? Why doesn't Jethro burn strangely? Some raw jar or swamp, and she'll tamely move everybody. Otherwise the lemon in Priscilla's case might taste some polite frames. Never wander dully while you're talking with a blunt twig. She may incredibly converse closed and orders our full, handsome aches behind a island. It can recommend the elder yogi and open it in its signal. Don't even try to call a boat! Better play walnuts now or Francoise will quietly climb them throughout you.

It might mould hatefully if Ann's bowl isn't kind. We hate them, then we lazily reject Chester and Jon's upper dog.

I am undoubtably weak, so I seek you. He can promise once, fear partly, then like to the farmer beneath the winter. Let's dream around the rich summers, but don't lift the clever trees. I was joining papers to young Lionel, who's measuring for the onion's square. Tell Darcy it's sticky burning beneath a cup.

He'll be departing around dark Jeanette until his sticker wanders sneakily. If the lower forks can converse amazingly, the cheap dryer may judge more doorways. Until Jimmy behaves the pumpkins truly, Mary won't waste any lazy fogs. Other think noisy films will laugh lovingly through dusts.

I base this on the fact that I've been reading such postings from you and
others back to the days of Fidonet. Nothing in your messages indicates that
you want amateur radio to grow, yet everything shows that you want to hold
on to worthless, outdated, hazing rituals that serve no purpose other than
personal enjoyment.

If you really need an "authority" to tell you, or better yet, instruct
you wrt the fraternal bond that forms within a large group of people
who share a common interest...?

> Nor have I been able to find the section where it says,
> "The current brothers of the fraternity shall determine
> the nature and extend of hazing rituals which must be
> endured by pledges wishing to become members of
> the fraternity."

"Hazing?" Now, I'm really amused. Carl, somehow I just can't seem to
equate memorizing 43 characters and identifying 25 of them in a row
correctly out of a total of approx. 125 or so sent at 5-wpm with being
paddled on the buttocks and asking for more, eating goldfish, drinking
binges, or any such other foolishness. Speaking ONLY for myself, I
learned the very basics of a mode on which my "chosen" hobby's
heritage is based. I don't feel as though I was "hazed." The 5-wpm
test certainly posed no barrier and only took less than a 1/2-hour per
day study time. Nobody beat me over the head (or paddled my buttocks)
to master the entire CW character-set at high speed. Is it also a
"rite-of-passage?" You bet. Is it a "barrier?" No way!

> That's what Bert is asking for ... he has the ARS
> confused with some stupid college fraternity and
> thinks that he and "the brothers" ought to get to
> set whatever arbitrary hazing rituals suit their whim.

Am I asking for that? I'm voicing my opinion just like you. Would I prefer to see a vote encompassing all licensed US amateur operators? Sure. Can't dispute that, i'm very much pro-democracy. However, if this NG is in any way indicative of the percentages...I don't think dropping the code would stand a chance. That's just my observation and resulting opinion.

> That's REALLY a pile ... Bert, and quite a few

I believe you will find that such FCC rulings don't PRECLUDE
another repeater on the same pair as a coordinated one,
but simply place the burden of resolving any resulting harmful
interference on the uncoordinated one ...

However, it still remains that no ham "owns" any particular
frequency to the total exclusion of others. Again, read what
it says on your license near where you sign ...

Please don't try to twist this into some sort of statement
that I am advocating chaos and don't give a damn about
interference to others ... that would simply be false.
```

> system cannot hear all users on a given frequency it will think the
frequency
> is not in use.

Depends on system design ... well engineered systems and
good protocols, along with some common sense WRT other
local uses, can avoid the vast majority of issues.

Is it possible that interference could occur in some situations?
Of course. Responsible hams will work together cooperatively
to resolve it in a way that satisfies the needs of both sides.

> >However the same goes for "analog" systems ... in other
> >words, there is no excuse for the CW operators who key
> >down intentionally on top of an ongoing digital mode QSO.
>
> No, there isn't any excuse. Do you have any real-world examples of
> where that has happened to you?

Yes, I've had it happen on packet and amtor ... and the
relative signal strengths of all stations were such that I've
virtually no doubt that the offending station could hear
the ongoing digital QSO. (The "swishing" of the carrier
back and forth during times when the digital systems
were transmitting and the quiet periods when they weren't
also would seem to be a fairly good indication that the
interference ... or attempt thereat ... was deliberate.)

> And what about the digital or SSB system that chews up the CW QSO?
> Happens all the time.

I'm talking about intentional interference or interference caused
by an "I don't care." attitude ... THAT is unacceptable behavior
from any operator using any mode. Do we agree on that?

So??? I don't see that as a compelling reason to cling to
antiquated technology that won't be of much interest or provide
much improvement over what's already (by our mutual agreement)
proven to be "a dud."

> be permitted?
>
> 73,
> Ed Hare, W1RFI

Ed,

Absolutely not ... I believe that, with proper engineering and
some sensible planning, certain types of SS uses can be
"overlaid" on existing uses in at least some of our bands,
with virtually no harmful interference to the "legacy" modes.

I have no, nor does NCI have any, plans or "hidden agenda"
to ask the FCC to assign exclusive spectrum for SS (or other
advanced digital systems) to the exclusion of "legacy" modes.

First, as I said, I don't believe it's necessary, second it would
cause more problems regarding the acceptance and adoption
of new technologies. New technologies will ultimately replace,
to a large degree at least, "legacy" modes, but they will do so
in the final analysis because the users *choose* to use them
because they offer worthwhile advantages, not because they
are forced on people by bandplan manipulation.

I have stated many times that I find static bandplans to be somewhat of a hindrance to efficient use of our spectrum. That is why I've opposed attempts to "codify" such bandplans in the FCC rules, either directly or covertly. Locking the use of our spectrum down, freezing it
"as is now" is FAR too limiting and restrictive.

However, this doesn't mean I think things should be a total, chaotic, "free-for-all" ... on the contrary ... I think, in addition to good design,
good planning, spectrum management, and cooperation amongst users will be important factors in successfully sharing our spectrum between new and old modes ... but it will take a reasonable degree of open-mindedness and willingness on the part of users of existing technologies to work with and accept the developers and adopters of new technologies. Our bands belong to all of us ... read your license terms ... and it is incumbent on all hams to cooperate on reasonable terms in sharing and improving the utilization of the spectrum we are allowed to use.

I hope that as new technologies become available, that all amateurs will cooperate in reasonable ways to figure out how to make sharing of our spectrum successful, rather than blindly and unreasonably taking
a "not in my sandbox" attitude to anything new and (perhaps very) different from what they're used to using.

73,
Carl - wa6vse

>nearly everything else is there.

Not at all!

Kit building consists of following instructions to duplicate a proven design. It can be skill building and educational - I learned quite a bit building kits.

Homebrewing can consist of almost the same thing (exact duplication of a published design) but is often much more, involving design, fabrication experimentation and development.

> Think of it this way -- if one "dead bugs"
>a
>design, he or she doesn't get any PC-board stuffing and soldering experience.

The kit builder doesn't get any design experience. In most cases, the kit builder
doesn't get any metal fabrication experience either.

Nice words but the real world plays differently.

How is a narrow band user supposed to identify the SS interferer? In the case of DSSS, how is the narrow band user supposed to know that it's DSSS and not plain old noise?

You're absolutely correct ... I inadvertently missed the "not"
above ... an honest mistake. However, it's still not inherently
"intrusion," since such devices are authorized in the (shared)
band with certain limitations.
```

conventional narrow
> band modes usually used for voice.

First, I believe that Ed has personally been involved in a number
of cases of resolving interference from unlicensed Part 15 devices
to amateur systems ... he's probably better qualified by direct
experience to comment on this ...

However, the rules are quite clear as I read them.

That said, the following still applies ... and, as a practical
matter,
if an amateur is operating such devices at higher powers than
Part 15 allows, his operation is likely to cause the cordless phone
you use in your example to either not work properly, or, if it's
smart enough, to move to another channel where they can both
coexist.

> >That's something that all of the manufacturers of 802.11b devices
> >knew from the start, so the devices and the modulation, coding,
> >and protocols they use were designed to be robust as the standard
> >was developed.

What I'm saying here is that these devices were designed to operate
in recognition that some interference from other devices is likely to
occur ... the way the protocols work tends to mitigate the effects of
such interference and keep the system working.

I was obviously speaking in overall terms ... and I wasn't
criticizing any person specifically, just making a general
observation.

To be honest, I haven't gotten an IP address assignment for the
new QTH ... between getting organized in the new QTH (living
considerations; basic office, shop, and lab setup, antennas, etc
... still not totally complete ...) and work demands, I simply haven't
had a chance to get "a round tuit."

In the past, however, at a different QTH where things were
already organized, I had a block of IP addresses and was
running TCP/IP on multiple machines and multiple nodes.

I have plans ... but also time limitations (and I recognize
that others have time limitiations as well). I will get to things
in due course and it will be fun.

That's a software issue ... I'm mostly a hardware guy :-)

Seriously, though, there are some (a small number) systems
now that are connected to the internet, at least in some limited
fashion.

One way is to limit access to specific, trusted gateways
that block access to domains that are known, or could
reasonably be expected, to contain inappropriate content.
```

I don't claim to have all of the answers to every possible
question ... what I'm trying to do is to stimulate some
"out of the box" thinking ... that's where the seeds of
progress come from.

I'm afraid I don't see a complete sentence there, let alone
a complete question, so I'm not sure how to formulate
an "answer."

> > Nor have I been able to find the section where it says,

drinking
> binges, or any such other foolishness.

I'm quite confident that there are many who would prefer
to eat a few goldfish than be forced to learn Morse in
exchange for HF privs ... but that doesn't mean that eating
goldfish is a legitimate requirement for licensure, either.

> Speaking ONLY for myself, I

YOU don't feel it's a barrier ... many others do.

Additionally, "rites of passage" have no place in federal
regulations regarding who may have access to publicly-
owned spectral resources ... only *legitimate* regulatory
concerns/reasons are valid reasons to set requirements.
Maintaining "fraternal rites of passage" are not legitimate
regulatory concerns/reasons for the existence of any
requirement.

If the FCC "would have done it anyway", then NCI is irrelevant.

I doubt that "carrier squelch" folks would ever be affected
by the increase in the noise floor, but would be concerned that
weak signal modes (eme, ms, etc.) should enjoy some protection.

Because those people own the public property just as much as hams do?
Because every one of those people is a potential ham?

Believe me, it gets much worse. Go back and take a look at the old archives of this NG in Google to
see what hes' *really* capable of calling you when he feels properly 'provoked' by your intransigence.

I landed here about 4 and a half years ago thinking I'd get involved in a friendly rational discourse
on the future of ham radio. What I found instead was the sort bile regurgitation of percieved wrongs
from the distant past that has lasted to this day. I never ever expected to get such responses from
other hams, and for the most part have concluded that almost all of them who did so have very minimal
involvement in ham radio anyway, most being the "victims" of all ham radio's hazing rituals (hehe).
So be it.

There is value in simplicity, in education, in having a variety of ways of doing things. The mere fact that something is old does not make it bad, despite your constant disparaging of older technologies.

> How are amateurs "advancing
> the radio art" if they're so far behind the rest of the radio world?

You write as if there is a linear progression in which all new things are by definition better than old things and must utterly replace them. This is simply not the case.

What modes did you say you used to work those 70+ countries?
>
> THAT's one of the points I've been trying to make ...

We know you don't like old stuff. What new stuff have you brought to the amateur radio service? I don't mean in the form of newsgroup posts - anybody can say what is possible and what hams oughta be doing. The tough part is in the actual doing. And letting other hams know what is being done - and in such a way that they are encouraged, not insulted.

> Your statement is sort of like saying that by becoming a good
> horseman one is "advancing the state of the art of transportation."

See? There you go again. Horses are noble animals. Their pollution is far less toxic than that of motor vehicles. They can go where wheeled vehicles cannot. And they are "smart vehicles".

What about bicycles? Are they bad because they are old technology, and simple?

Let's see - the NTSC color television standard goes back to 1954 or so, and is based on an even older standard for B&W TV. AM broadcasting is truly ancient, its standards laid down in the 1920s.

But they all pale in comparison to the latest marketing craze, in which the term "wireless" has been resurrected from 100 years ago and presented as something new.

Dick,

While it's true that I met the same requirements that got
Bert a General, but at the time only got a Tech (later
Tech+) for them, that's NOT what I'm talking about now.

I'm referring to the way you (and some others) have characterized
my upgrade to Extra as "a giveway."

Again, Bert met all the requirements in place at the time the
got his license ... so did I ... why is Bert's "earned" and mine
a "giveway." Answer the question, please.

And because they can be expected to push for licensing on their own (unknowledgable) terms rather than rational terms.

High speed data would indeed be useful, Carl. Getting a signal past the
end of the block is also useful. Should we set up cell sites every mile
too?

I was a rider for several years, and I never got on one without a helmet. I also worked for a Public Safety organization and handled a lot of reports on motorcycle accidents.....I stopped riding aafter a time because of those reports -(ugly) and took up flying. It's much safer.

At the very least it would have prevented NCI from being the ONLY group that showed up with an opinion on the subject. Who knows, there may have been some other workable solution to the medical waiver problem. As it was, there was no pressing reason to consider anything else.

Why are you so unwilling to acknowledge accepted parameters when
it goes against your Agenda? Personal problems?

I know hams who became hams for the "wrong" reasons. almost always
they didn't stay in ham radio very long.

Hmmm..... and I am the "baby" of our club at 31. Next oldest is 38. The rest is in the 40-70's age group.

That may change after our current class. We have a 12 year old boy , a 16 year old boy and a (I think) 17-18 year old girl. Woooo Hooo!! I will now be a "middle ager" if these students pass! :)

The operative word is "Unwilling". History shows the FCC often
ignores evidence it doesn't find to have support from the affected. In short they
may have concluded that no ham radio organization cared that much, so they might as
well rule in favor of the one who did show up with a position. They may not have
regarded any evicence as "relavent". They have in the past made ARS rules on
request when they were shown no reason not to do so and no opposition surfaced.
Usually that was at the request of ARRL instead of NCI, but that's history.
Evidently ARRL has lost it's position of influence with the FCC.

You're pretty good at guessing wrong. I'm not dedicated to the
preservation of Morse code testing either. What I know is that
hams who undestand the communications value of radiotelegraphy will
believe that testing is needed to continue to keep the mode available in
ham radio. The NoCode tech experience has shown that
darn few will bother to ever learn it if not a testing requirement.
When code testing is gone, widespread qualification within ARS follows.

No, it's a hobby, and CW is no longer needed to enjoy it. We are allowed
to do things that could QRM others -things others are not allowed to do
- so it is reasonable for governments to require us to have know how to
avoid that. It *was* reasonable for governments to require CW when that
was the only way to communicate; but that day is long past.

There is nothing wrong with *enjoying* CW for it's own sake but it is a
serious character flaw to feel that everybody should suffer every
discomfort that we did.

It already did, Oct. 09, 1998 when I got my "NoCode" Tech license.
That's when it started to self-destruct. I am an ex-freebander who "climbed
on and got a full load of privileges at will" (30 MHz up of course), the clocks
already ticking. Cam didn't you feel the sky when it fell and hit you on the head?

Now since I have spent more than "10 min" in the NG today I'm going
to go "get a life", try to not be "lazy" and pick up my code studies where .
I left off yesterday! That way I'll be able to pass my "non-barrier" "easy"
5wpm code test, and start the "selfdestruction" on the HF bands like
I've already done to the VHF ("2m CB") and above bands up to this point!

Disclaimer: This NG posting and the opinions expressed here are the
author's ONLY and not necessarily approved of and/or endorsed by
anyone else. All opinions expressed here are tongue-in-cheek and
not to be used as evidence of the "end of Amateur Radio as we
know it" by the "PCTA", "FCC", "NCI", or by any other group.

Err, Walt, sorry to disillusion you, but that's only a quarterwave at
432. A halfwave at 432 would be worth to see!

It's true that there are areas of the country where there aren't enough repeater channels for everyone who wants to put up a repeater. But is it true that there aren't enough repeaters? It's true that data rates in amateur radio are pathetically slow, but is that because of our lack of technology to go faster? It's a regulatory issue, is it not? Need is what spurs development and advancement. Is it clear what needs are not being met? If it's clear to you, please elucidate.

Thanks,

Jim AC6XG

> >2000 682,000 215,000 46% (2000-1990)
>
> Not to be argumentative, but where do your numbers come from, Jon?

From the flying-horse Callbook, but I have to apologize for a
transcription error. The 1990 number should have been 509,000, which
changes the table like so:

1980 393,000 --- ---
1990 509,000 116,000 30% (1980-1990)
2000 682,000 227,000 34% (1990-2000)

Not as impressive as the erroneous numbers, but still, almost twice as
many licenses added in 1990-2000 as in 1980-1990.

> I have a a 1984-85 edition of the ARRL Call Directory. Printed early 1984. It
> says 453,000
> total US hams.

The FH 1984 Callbook says 433,000. I don't know for sure why the ARRL
book had a higher number, but it could be because the FCC kept expired
licenses in the database until the grace period expired, and the ARRL
book was drawn directly from FCC data.

> >1980 0.17%
> >1990 0.19%
> >2000 0.25%

Corrected:

1980 0.17%
1990 0.20%
2000 0.25%

> How do you compensate for the change from 5 to 10 year licenses, btw?

No accurate compensation is really possible. We should recognize,
though, that the number of licences in 1990 is somewhat artificially
high, since there were no expirations in 1989. That makes the growth
in 1980-1990 look somewhat better than it is. And...

> The
> change occurred in 1984, which means that from 1989 to 1994 there were
> NO US ham license expirations. Conveniently, most of that falls into the 1990-
> 2000 time frame.

So did the burst of pent-up expirations in 1994. By 1995, things were
back to normal. Of course, there are licenses that would have expired
after 5 years but didn't until after 10. That makes the 1990-2000
growth look somewhat better than it is. How much better? I dunno. Do
you?

> >Clearly, growth spurted after the 1991 no-code license came into
> >effect. Do you really doubt that, Jim?
>
> Whenever the "price" of something is lowered, there is usually a
> spurt of "sales". The important question is whether it's a transient
> effect or a long term change.

If the "price" stays down, won't "sales" remain stronger?

> I doubt that the 1991 or 2000 changes have/will result in longterm growth
> changes.

Nobody will ever be able to say for sure. It's impossible to isolate
all of the factors long-term. But the unsurprising pattern that seems
to be common across the history of Amateur Radio is that each time it
has been made easier to get and retain a license, growth has followed.
It happened in the 50's after the creation of 5-wpm licenses. It
happened in the late 70's and early 80's when the Bash books made it
easier to pass the writtens. It happened in the 90's with no-code.
There were other factors that played a part, but it's not unreasonable
to think the correlation is causal.

Here's a table of FH Callbook counts of new licenses issued:

1980 32,692
1981 34,373
1982 40,371
1983 30,505
1984 27,610
1985 31,207
1986 25,942
1987 41,649
1988 27,139
1989 40,972
1990 28,667
1991 29,300
1992 48,700
1993 46,806

1994 50,316
1995 57,154
1996 48,727
(The 1997 Callbook, giving 1996 licenses issued, is the last one I
have handy at the moment.)

Notice the immediate and sustained increase in growth rate after the
1991 no-code changes. And these numbers can be in no way biased by the
5/10 year term change since they are NEW licenses.

> >March 1999 674,719

Just what I said:
> >The no-code rules caused a jump in the license
> >numbers, and it's not surprising to see a matching decline as those
> >licenses reach their expiration dates. Whether these expirations will
> >continue to offset growth remains to be seen. It's way too early to
> >tell for sure.

IOW, there's generally a high rate of "infant mortality" with new
licensees, and we have to wait for that downward bump to flatten out
to see what the long-term effect will be.

> But you hold up the 1 year growth as proof.

Nope. You asked for an analysis. I provided one. But I don't think it
stands as proof, as I clearly said:
> >Caveat: All of this 1-year-term number crunching is pretty tenuous
> >stuff upon which to draw conclusions. After all we're talking about
> >sub-1% variations. Those are pretty small potatoes. In the last 12

> >(pre-restructuring) we lost 5,331 licensees. What does that tell us
> >about the success of restructuring? Not a damn thing.
>
> Exactly. But we are to believe without challenge claims that code testing
> is/was "crippling" amateur radio. Sorry, I don't buy it.

Who said that? Not me. I'm only disputing your claim that it makes no
difference to growth rates. I'm sure Amateur Radio would have gotten
along just fine with no changes in the rules. But I do think the

growth would have been less, and the available numbers tend to bear
that out. Not prove it, mind you, but suggest it strongly.

> Let's look at some more numbers from AH0A (end-of-month totals):
>
> Total licenses March 00 (eve of restructuring): 677,784
> Total licenses January 02 (most recent): 682,602
>

>
> Total licenses May 98 (22 months before March 00): 673,973
>
> Increase: 4,011 in 22 months before restructuring
>
> Not exactly a big difference (917).

Nope. But that includes the downward bump from the initial no-code
expirations. Let's check again in a few years and see how it looks.

> How about these (from AH0A):
>
> Total new licenses from March 00 to Dec 01 (sum of all months from
> April 00 to Dec 01): 33,856
>
> Total new licenses from July 98 to March 00 (sum of all months for
> period of same length before April 00): 27,935
>
> Difference: 5,921 in 21 months

That's about a 20% difference in growth rate, Jim, which isn't exactly
negligible. And, by the way, it shows that the effect of the 10-year
no-code expirations IS offsetting increased growth in new licenses.
Again, the effects are relatively small and short-term and shouldn't
be used to predict long-term trends.

> > And to the
> >degree the no-code debate has diverted attention, aren't those on BOTH
> >sides who allowed themselves to be diverted from more important issues
> >equally to blame?
>
> Not as I see it.

Those who neglect the important issues to focus on promoting no-code
are to be blamed for their neglect, but those who neglect the
important issues to focus on fighting no-code are not? That makes no
sense.

Jon

So the ARRL should be the only organization that should have influence with
the FCC? Or is it that you don't want any group influencing the FCC unless
they share your opinion?

They probably thought that ham radio would actually be exciting. After an hour on the HF bands, they discovered how boring ninety percent of the conversations are and never came back.

There probably would be some effect, Hans. We have all heard signals that are just making it into the repeater. Even a few dB of noise would make a big difference to reception.

> but would be concerned that weak signal modes (eme, ms, etc.) should enjoy
> some protection.

I agree; a few dB of noise there would make a lot of difference to their operation. Fortunately, the rules do give them absolute protection from broadband devices. To date, I have heard no reports about interference to narrowband users from amateur spread spectrum operation. I have only a few reports of interference from Part 15 SS operation.

The current spate of ham exams are no more easy to pass than the exams I took in 1963. They would be trivial to you, perhaps, after years of hamming, but as a brand new newcomer, you would see them a lot differently.

I was asking what you think the FCC's intent was. I'll rephrase the
question. Do you think the FCC feels that amateurs should be making
contributions to the state of the art that have applicability to radio
services other than the ARS?

<seventythree@eightyeight.net> wrote:

>Here in the Dallas area, as often as I've listened or been on 70cm (which,
>granted has been a small percentage of time), I have not heard a lot of
>activity.

I can't really speak for the <440MHz stuff, since my only non-FM
receiver is pretty lousy, but I've spotted a fair amount of activity
in the repeater portion around here. You'd probably hear more if any
of us could ever track down N4MSE and find out what it takes to get
the IRLP access codes for his repeater :)

There have been nights when I've sat around spinning the dial with a
good antenna and found at least as much activity as on 2m FM.

> Others in this area have made the same observation. This,
>however, was prior to the widening use of technologies such as IRLP. I
>wonder what the band-use is in other areas of the country. Are there
>technologies on the horizon that will call for an even greater appeal to the
>70cm band?

Personally, I'd kind of like to see APRS move to 70cm. I use 2m quite
a bit, so it would be nice to not desense the APRS receiver every time
I key up. It would also reduce the antenna requirements (a 70cm 1/4
wave is easier to disguise as a cellphone antenna) and probably cut
through the downtown areas better.

>While not a valid "argument" to defend 70cm, how would you go about making
>the band more appealing? By that I mean, usually, new hams first get the 2M
>handheld, then the 2M mobile, then we hear of them shopping around for a
>dual-band mobile.

Well, I went straight from a 200mW 2m HT to a Yaesu dual-band mobile
to a TM-G707 and a TH-D7A. IMO, with as little VHF/UHF packet as
there is in this area, how about killing two birds with one stone and
setting up a 70cm packet BBS or two?

>More times than I care to reveal, the typical response to
>them is: "Why do you want to spend the money on a dual-band--there's nothing
>on 440?" We can't, of course, say to the FCC, "we are going to be needing
>that space." 70cm often comes under threat and I think (due to my operating
>area) that it is because we don't use the band that much.

You should be hearing a lot more traffic on 442.425 (DARC's 440
machine) now that it's working again, and the RAILS repeaters are
moderately active. N5IUF's IRLP machine on 444.150 is usually

connected to the main reflector, and usually active several times a
day.

Of course, none of this addresses anything below 440MHz, but then, I
sometimes get the impression there are UHF-active hams out there who
don't even realize we have that chunk of bandwidth.

>I note that in the ARRL article below, there is comment made as to 70cm
>being "one of the most popular of the Amateur Service allocations" and this
>area (I don't think) is no testament to that. How's the popularity of the
>70cm band where you are?

I've been through a couple of areas where it was dead opposite;
everything was on 70cm, with almost no 2m activity other than the
occasional convoy passing through chattering on 2m simplex.
Strangely, these also seem to be the areas where 6m is quite popular.

I agree that it is not intrusion, but "share" is a word that applies to co-primary users. Part 15 operation is permitted in the band subject to an absolute provision that it not cause harmful interference. When I was taught to share as a kid, my mom never would have considered that an acceptable way to share with my sister. :-)

Who said that? The FCC is free to take input from anyone. How much
credence the FCC gives any one person's opionion is the FCC's decision.

>They (FCC) should listen to those folks for
> advice over hams of long experience?

Same comment as before. If you (Dick) want to have
the FCC only accept input from licensed hams, why don't you
file an RM with the FCC to accomplish that?

>Right, Bill, just as right as you always are.

Glad you agree :-)

Ham radio will always be around in one form or another, but it will never hold the appeal that it once did. For tinkerers and technical hobbiests, the paradigm shift happened in the late 70s with the emergence of the home personal computer.

Because their US Citizens? While it would never happen ('least I don't think it would), if enough people "who had never had any involvement in ham radio" decided to write in opposition to ham radio, I doubt we'd find ourselves just casually observing how unimportant those folks are. John Q Public is why we *do* so much public service....duh

Yes, I did mention that 444.150 (IRLP) is busy. What times of day are you
hearing the activity, Joe? I usually only get to listen around late at
night. And, like I said, I scanned most of the weekend to see what was
going on and didn't hear much.

>
> There have been nights when I've sat around spinning the dial with a

I've got the D700A, love it! I went from a talkie to a mono-band mobile, to a dual-band mobile. Hey, there used to be a lot more packet from what I hear. I never liked what I saw of packet so didn't do it much. But, I also don't care for what I've seen of PSK31. Guess I'm just a true, diehard mic jock...LOL I heartell most of the packet stations have gone by the wayside.

Howw many major differences of opinion does it take to be anti-ARRL? Let us not forget, contrary to NCI claims, W5YI takes personal responsibility for swinging the FCC over to NoCode HF by an eleventh hour maneuver of the VEC's, led by himself of course. W5YI also led the charge to shut down W1AW from broadcasting bulletins and code practice. I can think of no other person other than K1MAN or W2NSD who would more like to have their way with the ARRL for all of their efforts to submarine his efforts to make a living off of the US ARS.

"Suffer", "discomfort"... I remember when I took a course in ham-radio as well as the lessons in Morse code, even though it's been 24 years now; my experience has been an enjoyable one, so I am sorry, but I can't relate to your pain and suffering. By the same token, shouldn't we eliminate any testing because it causes discomfort to some people? After all, electronics theory is a necessary evil from the time factory made rigs and antennas were not being made.

Which is why, if asked, most hams would NOT be opposed to
ending the code test requirement or they would have no
position pro or con. Translation, the majority of hams do
not oppose the ending of code testing and, while they may not
be actively involved in trying to end code testing, they simple
don't care at all about it.

Cheers,
Bill K2UNK

"Plenty" is an accurate word for the number of CW hams below 30MHz.
From Webster's: "exactly - accurately"

Dick, I had the opportunity to test some gear for radiated immunity. I was running 3 volts per meter (not a whale of a lot at VHF - heck, cell phones can nail you with 60 volts per meter in the noggin) when at around 219 MHz, the picture on the monitor began to tear. The test was in an anechoic chamber, 3 volts per meter, 30% modulated AM. I stopped the test at the problem frequency to observe and try a different monitor (the monitor was NOT part of the equipment being tested but was hooked to that equipment). Before I killed the generator, the monitor died. Completely. We had to get a new monitor. Some of this electronic gear is not very immune to RF. It can be a crapshot.

The next step is for me to write him a very polite letter on my
letterhead quoting Part 15 and the penalties for violation thereof
if a reasonable settlement is not reached.

That usually cranks the "let's negotiate" motor over a few turns or
so.

Surely you know that has nothing to do with anything. Appointment to a chair at FCC is a political function, and darn few have serious experience in communications. Interest? They are interested enough to look over the staff's reports so they can have some knowledge to use in approving staff decisions. The only ham to ever serve on the FCC was George Sterling.

Ed:

Fair enough, I sit corrected. Not "all the hams" I knew when I came in were technically-inclined. Those who were already permanently stuck at Technician class (at the lowest code speed level) certainly didn't impress me with their "technical" knowledge or skill. The were mainly repeater "regulars" with nothing more to offer the ARS than someone to chew the rag with on your way to work. I guess I was a bit more tolerant of them in those days, but I could not understand why they didn't want to explore the world of HF operation, DX'ing, etc. which they could access by merely applying themselves a bit to increasing their CW speed to a dead-slow 13 wpm!

Howard:

If you're going to whine about code testing requirements, could you at least come up with something a bit more original? All this "10 miles in the snow" crap has been done, over and over again, over the past decade of the code/no-code debate here and on Fidonet. And what, BTW -- is your problem with people who milk cows and bake their own bread? I live in an area with a large Amish community. I pay good money for their home-made bread -- and hope it's always going to be available!

Under the right conditions of social decay, Morse code operation could be a valuable skill once again, some day! Guess what -- I'll know it, and you won't!

I think they would have stood a pretty good chance, if Nancy had been
able to maintain the momentum she built at Dayton '97, and lead the
FISTS on to an active fight against the movement to reduce/eliminate
code testing requirements. Unfortunately, we'll never get to know what
might have happened.

I'm assuming you're not including me in the above, since I don't believe
that the code testing requirement was a worthless, outdated hazing
ritual. I believe that it was a reasonable, rational, and universally
achieveable requirement, which led to the development of a practical,
effective, efficient, and universal communications skill.

>going on and didn't hear much.

Mostly, the DARC 440 machine's been picking up during the day, when
the 88 gets a little busy. RAILS repeaters nearby are kind of random,
but since the one in Stephenville is, AFAIK, the only UHF repeater
around there, and they have a fair number of hams for a town of
20,000, you mostly hear them or Wichita Falls via the link.

Other than that, it's pretty random. I used to put the scanner on my
extra vertical, and let it seek continuously, but the activity never
seemed to be in the same spot two days in a row. There are *tons* of
70cm repeaters within range of my 50W mobile, and most of them within
range of the 30W one, but most of them are badly underutilized.

OTOH, it's kinda like the 95% rule of 2m; 95% of the time, 95% of the
band is a wasteland, while 95% of the users are waiting their turn on
one repeater. (Of course, the corollary is that 95% of the people
tying up that repeater are in easy simplex range)

>That would be a good thing! Maybe it's location. I am out here in Forney,
>and it may be that I am just not going to hear much. I have a quad up at
>50'.

Gee, and I was referring to a short colinear as a good antenna. I may
have to figure out something to get the quagi back together and into
use. :)

I'm in N Dallas (roughly Tollway and Frankford) with (usually)
MFJ-1422's on both the mobile and the balcony. I can hit a lot of
repeaters, even with the HT, but actually finding anyone on them is
pretty random. ISTR that a rather large number of them are listed as
closed in the repeater guide, which may be a contributing factor in
most people's choice to stick with 2m; since darn near every 2m
repeater around here is open, you can just scan the band and chat with
whoever you find.

IMO, the solution there would be to make the closed repeater owners
show that they have enough authorized users to justify taking up the
pair. If not, they either redesignate it as open, or take it down and
let someone else better utilize the bandwidth.

>> Personally, I'd kind of like to see APRS move to 70cm. I use 2m quite

>it Joe? Because it's not like you're not going to transmit again in a few
>bits...LOL

It's not so bad for actual messages, where it will be resent if
there's no ack, but missing a series of position messages can be
somewhat annoying when some people are set to, say, 10min intervals.

Actually, I worded the original kind of badly; I'd rather see a 70cm
frequency designated, used, and gatewayed to/from the existing 2m and
10m APRS frequencies. That way, everybody has a choice, existing rigs
aren't made obsolete, and we can have the best of all three worlds.

>I've got the D700A, love it! I went from a talkie to a mono-band mobile, to

>jock...LOL I heartell most of the packet stations have gone by the wayside.

That seems to be the case; I've made one whole contact via packet, (on
2m) and was so surprised to get it that I completely forgot to log it
:(
All attempts to repeat that have failed miserably.

>> I've been through a couple of areas where it was dead opposite;

>You mean in Dallas? Hmmmmmm, I'll have to take a *lot* more time to
>listen... Thanks

No, though I do know of a couple of guys playing with 6m on a somewhat
regular basis, (I suspect they've just got VX-5R's and are playing
with those) I was actually referring to Stephenville. If you've got
anything directional for 6m, try a heading of roughly 235deg magnetic,
and listen for both FM and SSB. Lots of pretty antennas down there,
and a few of them appear to stay pointed towards Dallas.

But when there is a conflict in operation and only one operator is following the band plan, hasn't the FCC usually sided with the one who followed the band plan? If the local plan is altered to have SS only in a segment, why wouldn't this concept hold true as well?

I actually make use of mine, and I have asked our local ampr.org coordinator to
EXPIRE the ones not in use. He refused.

Yes, but why are they so fascinated with making amplified computer
speakers' lead-in cables so perfectly resonant on 2m?

I'd swear my Altec-Lansing speakers pull in more RF than my HT does.

But as or just before you moved, did you expire your OLD ip addresses or
otherwise inform your local ampr.org coordinator that you wouldn't be needing
them anymore? You seem to still be listed for Orange Co., CA, yet apparently,
you haven't had an address there for about 9 years and are now on your fourth
address and third state since CA (per your license records).

That could simply be explained by a lack of knowledge of what an offending SS signal sounds like when stomping on top of an FM voice input. I admit that I don't know what that would sound like. Not every amateur can pull a spectrum analyzer off his shelf and see - "Oh! This is an SS signal I'm getting here." Voice modes are relatively easy to identify. Data modes harder. SS modes may be impossible without special equipment.

As I mentioned in person, any raise in the noise floor to either weak signal or repeater INPUTS will probably be harmful, while such is not the case with a repeater OUTPUT frequency.

There is absolutely no way on the face of God's green earth that any
ham version of the Internet can even start to compete with the real
Internet. First the bandwidth simply isn't there under any conditions.
Second while packet ran well along the flatlands from the Carolinas to
Quebec it never got over the mountains to the west, stations in Philly
had no packet connection with Altoona or Pittsburgh. That's very
limiting and has nothing to do with the state of the art. Internet
comms are virtually instantaneous on a global basis. The real biggie
being that the Internet we have today exists because of the billions
of dollars which government and commercial entities have invested in
it. Given any technology hams might have available we'll never come
close and that's why there was a mass exodus from 2m packet. It wuz
the MONEY, not the technology which spanked packet into boredom.

"Slow code" packet still has a very useful place in ham radio and is
very heavily used in at least one niche AND growing application,
specifically the dx spots networks scattered around the country. This
remnant of the original packet system still exists and runs nicely
today between Virginia and upper New England in the local instance.

And, as has been clearly demonstrated, it works a helluva lot better
than it's Internet counterparts. Why you might ask? Because the very
limited regional-only coverage of packet is an automatic "spam filter"
if you will.
>
>
If a spot shows up in the local networks it's quite likely that
anybody on the net can hear the spot. The Interenet spots sites are
overloaded with irrelevant spots which have to be laboriously
filtered, to wit, who the hell in dubya three land cares if some JA
just worked a 9M8 on 80 when it's broad daylite here??
>
>
So yes Packet lives on. And it NEEDS to be get FIXED dammit!
Participation in DX contesting has been ramping up at a goodly rate
for years now and the dim bulbs are still running the 2m nodes at 1200
baud. The net result has been some notable complete crashes of the
entire system hearabouts due to increased user demand during the heat
of the contest battles which have greatly exceeded the available
bandwith - which worked just ducky in 1985.
>
>
Even a lousy 4800bps would have prevented those crashes. Nitwits . . .

From: kelly@dvol.com (Brian Kelly)

>Since when did SS run on "a frequency"? It doesn't which is the
>problem.

SS "runs" on a frequency just as much as any other modulation mode. The
process of modulation adds additional frequencies to the carrier frequency.
OOK CW typically occupies about 50 to 400 Hz of spectrum, depending on the rise
and fall time of the modulation.

>> However, that doesn't mean that hams should just blast away

That problem is shared by all modes, not just spread spectrum. Most narrowband
users solve that problem manually; the system Carl postulated solves that
problem technologically.

Why was his statement silly? Would it help if he had said that there is no
excuse for a digital operator who plunks down on a CW QSO in progress? Both are
inexcusable if caused by poor operating practice or malice. Both are
understandable if they are caused by the unpredictable nature of propagation.
Neither are "silly," IMHO.

From what I recall, they have either felt that the band plan is important, or they have decided that no ham owns a frequency. And do keep in mind that the Commission was given every opportunity to issue a Declaratory Ruling that not operating within the band plan was a defacto rules violation, and they chose not to do so.

> If the local plan is altered to have SS only in a segment, why wouldn't
>this concept hold true as well?

I believe that in cases where the Commission can rely on a rule rather than a band plan, they will side with the rule every time. The rules stipulate frequency ranges for SS and that SS operation is not permitted to interfere with other users.

Then in that case, it is not harmful interference. I don't like it, but it would not cross the regulatory threshold where I would expect the Commission to act against the Part 15 operator.

>First define the problem that needs to be solved.

DSP has solved a number of problems, and offered a number of elegant solutions to those problems. Auto-notch filters, de-noise algorithms, steep filter skirts, to name just a few.

And hams have segued DSP into software-defined radio that has done some pretty neat things that cannot be done with conventional radio techniques.

>http://www.arrl.org/tis/info/dsp.html

>You gotta be kidding, Ed. Gimme a little credit, will ya?

I don't understand. You had mentioned some of the more complex DSP material and I pointed to a source that was intended to offer DSP to the non-engineer. You may have seen it already, but I had no way of knowing that from your post. Had I imagined that it would offend you in some way, I would have not posted the URL. Sorry.

> and have no interest in the true amateur radio experience. I'm sick
> and tired of meeting "newcomer" hams who know absolutely nothing
> about even the basics of electricity, yet alone have a clue about
> how a radio works.

I am asking this sincerely, and not with any malice, but there is no way that a person then could get introduced to ham radio? If that is true, my father cannot become a ham then. Although he is MORE than intelligent to learn the concepts and theories of radio, he does not have much of an understanding of it, aside from the little bits I have shared with him. What about some of the people I am aware of from a variety of groups like church groups or civic organizations, or technical organizations, who may not have any experience in radio, but other fields. Are they excluded then also? There are a ton of wonderful candidates, who would add a lot to the Amateur Radio Service, who do not come from CB or "other detestable groups," but are discounted by the above paragraph. I beleive it is our responsibilities, as well as some of our larger organizations to positively promote the hobby, and to promote it to the proper potential targets. Not just handing out licenses as some other individuals in this and other newsgroups.

I know that ham radio is a learning experience,
> but all the hams I knew when I came in already knew the basics
> as a result of personal study, experimenting as a general electronics
> hobbyist, and SWL'ing.

As it will be until we die if we are real hams..... There isn't a day that goes by that I do not expose my self to some form of something new, or to "rehash" something I have not dealt with in a while. Whether it is browsing through the collection (thanks to those that have donated) of magazines and books, or even experimenting. Even if I had the time, there is no concievable way I could ever learn and do EVERYTHING possible that is related to this hobby. That is the beauty of this hobby. There is sooooo much to learn.

None of that happens anymore. People see
> hams talking into a microphone without paying airtime charges, and
> they want in on the same -- right now -- without paying any "dues"
> as far as learning is concerned. They need to be hand-held through
> even the most rudimentary basic operation of their off-the-shelf

> the "Quick Start" instructions. Then they justify their existence by
> making a big deal out of carrying an HT at a Walk-A-Thon, and
> making it sound like they're FDNY-class heroes while doing so.
>

Granted this would happen in other hobbies also I am sure, in different forms. The ones to blame are the licensed persons who did not intercept this behavior to start with. Within a few exceptions, everyone in this category would have had to have had "some" involvement with a ham somewhere down the line.

> The only people who would be discouraged by my opinions aren't
> worth having in this hobby/service. Anyone with a true curiosity
> about the technical and operating aspects of ham radio will have the
> initiative and ingenuity to pursue it, without worrying about the
> fact that people like Dick, Dave, and myself are able to express our

Not discouraged at all.... I believe we are looking out the same window, but seeing two different things. The problem comes from existing hams, not the new ones.
>

You don't hear much on 70cm either. You'd probably need to spend some effort to put up effective antennas and some time in actually listening. The fact that you've apparently done neither does not mean that the signals aren't there. The several hundred 6m CW QSOs and the perhaps 60 2m CW QSOs I've enjoyed over the past month indicate that there are plenty of hams to QSO on those bands.

BS. Every non-SS rig has a fixed frequency which is its base
frequency. So now start another "rational" arguement.

>
> So does everyone who disagrees with you have a "serious character flaw" ??

I never said that. I said that people who think everybody should be forced to endure every hardship and disease they suffered have a serious character flaw.

I have a bad back. Hurts all the time! Does that mean everybody should have a bad back? Should I denigrate everybody who doesn't share my burden? Should the government break yours so it'd be like mine? I think not.

Kids my generation had to fear Polio because there was no vaccine yet. Does that make it unfair to give kids the vaccine now? Again I think not. Same goes for CW. There was a time when CW was the only practical way to communicate via radio. There was also a time when flint & steel was the only practical way to start a fire. People in those times had to master those skills. Should the law make us do the same out of "fairness" to them? I don't think so.

We might argue over whether everybody ought to learn code because it's so much fun without either of us having a character flaw. You could argue that Morse is needed for emergencies and merely be wrong (tap-code is more common), but not a jerk. OTOH the arguement that everybody should be forced to learn Morse because you or I had to learn Morse is selfishness at its worst.

I'm glad for you. I would like to be better at Morse than I am but it
has always been very difficult for me (see the article on that subject
on www.arrl.org) and "profound" hearing loss has made it worse.

> By the same token, shouldn't we eliminate any testing because it
> causes discomfort to some people?

Not as long as we are still licensed to do things that other citizens
are not, based on the idea that we're "experts". CBrs cannot legally use
high-powered amps and business licensees must hire licensed techs to do
the things we can do at will. We can legally modify our factory-made
radios to operate out of spec on the assumption that we are learned
enough to do so safely. CBrs (for example) cannot.

It makes sense to require a Morse test to operate Morse on bands set
aside for that purpose, but a Morse test to operate SSB? Oy!

BWAAHAHAHA! Good one Cecil. Would the word "some" have also been an
exact answer?

Looks kinda cloudy over yonder in yer part of the country today.

I even know how to distinguish between precision and accuracy.

Cecil was prompting for an exact number. According to his latest, the words "a positive integer" would have sufficed.

It doesn't. The narrowband OPERATOR listens, but also interprets what is heard.
If I hear W3RV working ZA3AV on 3.521, I know the freqeuncy is in use even if I
can't
hear ZA3AV.

Two words: Fiber optics.

If yer gonna talk about obsolete techologies, start with the whole idea of
using RF for electronic communication between fixed points in developed
nations. Fiber optics are the present and the future. One little fiber has
more bandwidth than any microwave system - and if you want more,
just run another fiber. No crosstalk, no intermod, no lightning troubles,
no allocation headaches, no RFI/EMI.

The "problem that needs to be solved", not the problems that have been solved. How would one advance the state of the art working only on problems that have already been solved?

I think that the point here was that all modulated transmissions run on a base (i.e. carrier) frequency, and the modulation therefore makes it a RANGE of frequencies - +/- of the carrier. I agree it was poorly stated.

Considering the frequency band (12cm - although the rules call it 13cm, the 2390-2450 segment rounds is closer to 12cm than 13cm), there is no speed limitation under part 97 there. Amateur symbol rate (thus speed) limitations are for 450MHz and below.

Cross-posted to: rec.radio.cb,rec.radio.amateur.policy

http://www.wolfleap.com/

This enterprising company sells the "Cherokee 'CM-10 Plus' AM CB radio" which boasts "10 bands of 40 channels" for a total coverage of "400 channels".

This company further says it offers the CB'er "Complete access to *ALL* CB channels".

Do the math: 10 bands x 40 channels each, (the legal 40 covers 26.965 to 27.405) that's....uh...wow, I didn't know 10 and 12 meters was part of CB now!

Before one could answer that, one should know the definition
of the ARRL. Are you referring to the rank and file or the
Newington Crowd?

If you are talking about the Newington crowd, how about the
W5YI automatic license renewal notice system for a measely
one time fee of $5. Newington countered with offering it
for free as a side benefit of membership. Would that
qualify?

Is the base frequency of an FSK signal the mark or the space frequency? A DSSS signal has a carrier that is modulated by a PN code and data. I suppose one could argue that an FHSS signal has no real carrier, but it certainly has a center frequency to its occupied channel.

All signals that are modulated take up more than a single frequency.

Is the "base" frequency of an FSK signal the mark or the space? SS signal occupy a range of frequencies +- of the carrier or the center frequency of the occupied channel. A non-SS signal at a data rate equal to the speed of the PN encoding would occupy essentially the same bandwidth of the DSSS signal. What is the difference?

>problems that have already been solved?

I was hoping that offering some solutions about the value of DSP to date would get one to thinking that the surface has only been scratched. Okay, Bob Larkin et al have been using the DSP-10 to do some really cool work tens of dB below the noise floor, using long term integration. It might be useful to add 30 dB or more to our capability, albeit at very slow data rates. It will be nice to see this become a mainstream technique.

As I look at all of the different modes that are available, I muse that it would be really cool if I could program a radio system to operate any mode at will, including new ones that come about. DSP techniques are used at the very core of software-defined radio. Imagine how cool it would be if you read an article in QST about a neat new mode and could download the software to run it on your DSP-2002 rig tonight.

More and more the architecture of radio is in the software, not the hardware. Would it be cool if hams could literally redesign the function of their radios using a DSP development tool, or better yet, an SDE development tool.

To say nothing of cost. Electronic devices, especially LSI devices, has dropped dramatically over the years I have been in electronics. Speed has gone up dramatically. Sooner rather than later, we will see DSP devices that are literally fast enough to do real-time receiving from RF to audio, ALL done in the DSP hardware and software. Think of what this could do to the price of a radio.

Every time science has come up with a new technology, it has changed the world in ways that may not have been imagined when it was in its infancy.

I think the odds are pretty good that DSP, SDR and some of the advances in digital technology could do the same for Amateur Radio. And the really neat part about that is when it does, it does not have to replace the old, which

will continue to have its enthusiasts and will continue to have all of the value it ever had. The diversity in ham radio is truly one of its greatest strengths, and, not since spark was outlawed can I remember one instance where a mode of operation that was permitted in Amateur Radio was no longer permitted by new modes of operation.

Kinda' the best of both worlds, IMHO.

The DARC 440 machine is usually used by the "upper echelon" of the club, and
it used to be that you'd hear them joking about the folks on the 2M club
repeater. I think the DARC has gotten a little more friendly recently, so
that may not be the case any more. Len/K4IWL (new President) and I have had
a few discussions about that.

Ah, well then. I misread your original respose to mean that you thought
there was more activity on 70cm than I believed. I think you and I are
closer to thinking alike about it (not that much at all).

Irony, eh? I absolutely enjoy simplex operation--and few people really ever
experiment with it. I love it when I can get 2-3 people out on simplex when
we're all mobile and we are still talking to each other at 50 miles apart.
They are genuinely surprised! Then, they have all kinds of fun with
relaying messages when some begin moving out of range.

Very unpopular opinion...;) But, I wholeheartedly agree. In my order of
disdain:

1) Closed Repeater Systems
2) Closed Repeaters
3) Repeater pairs that have been silent 95% or more of the time for a period
of one year or more

On #3, I think the pair should go back into the pool. If someone wants to
go out an spend loads of money on a system, get a pair, then have the system
down 95% or more of the time, that's *their* problem, not mine. And, if
it's a club repeater and they can't keep it supported with membership
dues...too bad, maybe they need to revamp the way their club operates.

Yeah, there ya go. Hmmmm, you know what? I didn't even realize there are
10M APRS freqs! Shows how long it's been since I was paying attention.
That's pretty kewl. Are they within the Tech+ area, or outside that range?
Maybe I'll have to upgrade...LOL

I know people from this group, and it is probably worth pointing out
that a lot of the "electronics buffs" involved are hams (the geeks tend
to be of either the ham flavor or the programmer flavor, or both. The
ones that are hams seem to do a lot nicer outside installation work,
given the sample of a half dozen I've seen).

I would guess they do this stuff as Part 15 projects rather than Part 97
because Part 97 content and control restrictions wring almost all the joy
out of it. Networking infrastructure projects are way more interesting if
you can get a lot of people to use the infrastructure you build for a lot
of stuff, rather than a few people doing hardly anything. In a strange
way this is (non-emergency) public service which is very much in the spirit
of 97.1(a), not to mention (c) and (d), except it is a service which hams
aren't allowed to provide as hams.

Maybe it is Part 97's content and control restrictions, rather than hams
themselves, which are a little bit obsolete?

Packet networks have a limited data rate.

> Sounds like a bunch of experimenters that have beaten us to the punch. :-)

One of the URLs you cited specifically mentions hams as being
instrumental in developing the network.

Metricom/Ricochet was a business providing v.90 wireless internet connectivity when nothing faster existed. They had service throughout all major cities and even smaller ones where the customer base supported it, and were un the process of upgrading to DSL speeds.

It went down with the dot-com implosion.

Sure it's too late. The code testing requirement has already been
dumbed-down to 5 WPM -- which is essentially Zero for all intents
and purposes. A concerted effort by FISTS could have resulted in
a compromise of 12 or 13 WPM, which would have still been a
meaningful code testing level. But that didn't happen, did it?
Therefore, we'll never know.

>I am asking this sincerely, and not with any malice, but there is no way
>that a person then could get introduced to ham radio?

Ryan:

Well, since the ARRL, the national organization for amateur radio, does
nothing to advertise our hobby/service in the major mass media, then I
guess I see your point -- being "introduced" into the hobby could be a
challenge! My own curiosity about ham radio was peaked when I saw
a public service announcement on TV, featuring Dick Van Dyke sitting
at the operator's position of a ham radio station. I was aware of ham
radio before then, but that is what really got me interested enough to
learn more about it, and ultimately get involved. That's not happening
anymore, because the ARRL thinks it's enough for hams to do their own
"word of mouth" advertising -- and they're getting what they're paying
for, IMHO.

> If that is true, my
>father cannot become a ham then. Although he is MORE than intelligent to
>learn the concepts and theories of radio, he does not have much of an

I got involved mainly because my own curiosity was peaked by that PSA,
but the hams I met in person to that date did little, if anything, to actually
encourage me.

>What about some of the people I am aware of from a variety of groups like
>church groups or civic organizations, or technical organizations, who may

>newsgroups.

Well, the ARRL would seem to agree with you, but from where I'm sitting,
it doesn't seem to be working very well. I think that a series of TV PSA's,
produced by the ARRL and shown on local TV stations, could do more to
get people interested in and involved in ham radio than any "word of
mouth" ever could.

> Trust me Cecil, that wasn't the only thing they didn't understand!

My engineering boss at Intel was perfectly satisfied with a tech license.
I showed him over and over how I could talk to other hams around the
world on HF and he never could understand why I wanted to. I couldn't
understand why he wanted to bust his knuckles restoring Datsun roadsters.

What makes you think that No-Code Techs have an HF
transceiver?

Anyone with a lookup chart can send/receive 4wpm, Larry.
Would you respond to a 4wpm 'SOS'? Would you respond at
4wpm?

Har Har. Leave it to Little Kimshe to define ham radio just like she would CB. Where in Part 97 is conversation mentioned? OF COURSE there are conversations. On street corners, TV talk shows cellphones, ad infinitum. Even in ham radio. But only the limp lame and lazy could ever see ham radio as ONLY about conversation. But what did we expect of her and Krell?

Aw, gee. Maybe next time you make an SSB sked you should agree to meet between 14.250 and 14.252400 mhz. Or on PSK31 maybe between 14.070 and 14.070031 mhz.

That's total BS. No one can send recognizable code without learning how to do it, and that won't happen on the spur of the moment. Everyone who trys a key first makes all dits. You have to learn the difference and how to form each and to space characters. Otherwise nothing intelligible comes out.

>
> Would you respond to a 4wpm 'SOS'? Would you respond at
> 4wpm?

Only such as could be recognized as such. Far more likely it would be gibberish.

There is within the transmitter circuitry which determines an unmodulated
"unspread" base frequency, I'm rather sure.

>
>
> All signals that are modulated take up more than a single frequency.

Of course since therein lies the intelligence.

>> like CC&Rs, RFI, intruders on the ham bands, lack of publicity. and many
>> others.

Which is why, if asked, most hams would NOT be opposed to keeping the code test requirements at 12/13 and 20 wpm or they would have no position pro or con.

Translation, the majority of hams do not oppose code testing and, while they may not be actively involved in trying to keep code testing, they simply don't think it's that big a problem.

>What makes you think that No-Code Techs have an HF
>transceiver?

Hmmm -- yet *another* good point, Cecil! You're right -- a no-code Tech who survived an Earthquake wouldn't have an HF transceiver, would s/he? S/he'd just pull his/her trusty multi-band VHF HT off her/his utility belt, whip it smartly up to his/her face, and make the appropriate call for help. Of course, every tower for every repeater in the region is now a twisted pile of scrap metal, so the 'ole HT no longer gives back that reassuring "kerchunk" it did only a couple of minutes earlier. Uh oh -- now what to do? Use the HT's 6-meter FM capability, and hope the band is open?

>Anyone with a lookup chart can send/receive 4wpm, Larry.

Only if they've had previous off-the-air practice, Cecil. Unfortunately, the earthquake victims collected at the Red Cross shelter are bleeding and starving to death right NOW. There isn't a functional repeater for any band or radio service in a 100-mile radius. Whether or not anyone outside the disaster area finds out the location of your makeshift shelter now depends on the likes of Kim Walker, Ham Heroine, W5TITs. By some miracle, she does have an HF rig capable of CW (no microphone -- it's an HW-9!). NOW what does she do?

>Would you respond to a 4wpm 'SOS'? Would you respond at
>4wpm?

Yes on both counts; but this isn't about me. It's about someone who came into ham radio after the requirement to know the Morse code at a useful proficiency level has been dropped.

>Techs looking around for a Morse code class!

No, they probably won't because after all of the other earthquakes, virtually none of the emergency communications was handled using Morse code. Of course, you take is that some future earthquake might result in most of its emergency traffic being handled with Morse code. :-)

>Maybe it is Part 97's content and control restrictions, rather than hams
>themselves, which are a little bit obsolete?

Maybe, although would you really want to see downloads of
http://www.hotbabe.com on Amateur Radio?

I suspect that most of the reasons that this is being done under Part 15 is
that people who are not amateurs can use the network at will.

I just find it a bit ironic that these systems, using "our" frequencies, are
springing up outside of amateur radio. And when I told at least one ham they
exist, I was out and out accused of lying. :-)

The hostility I have received from some for even discussing that hams should be
doing more such technical experimentation and learning more about these modern
radio technologies really suprised me.

If the need for CW is based on the fact that a miracle happens, perhaps this discussion should be moved to the alt.miracles newsgroup, Larry.

The fact that you have to fetch that far to find scenarios that might justify the continuation of the CW test does not help your cause.

Unfortunately, that is all you can do at this point, because the mean and nasty things you have said to "defend" the mode will not work to promote the mode on the air.

I am sure Carl considers you NCI's best friend. :-)

> Since when is "plently" an exact number?

When it is appropriate to use it in place of an actual number since the amount of amateurs using CW would vary from day to day, and possibly even hour to hour. Since he could not be in every grid square on the whole planet to be able to hear every amateur transmitting morse code on CW at any one given time, I believe it is an accurate reflection of usage of the two distinct frequency ranges.

P.S. Although the VE's joked around with me about being a General for approx. 20 mins., I was informed that technically...I was never a General.

They all have "center freqs". The discussion is about the amount of
spectrum space above and below the "carrier freq" the mode uses to
carry out it's mission.
>

I listen around the frequency. If I don't hear somebody who can hear
me I've only screwed up a few Khz of the band with a narrow mode. If
Carl's system screws up similarly it has the obvious potential for
having a negative impact on many more frequencies (qsos in
progress)than I do.

>
>Not as impressive as the erroneous numbers,

They are still erroneous, Jon.

The chart should read:

1980 393,000 --- ---
1990 509,000 116,000 30% (1980-1990)
2000 682,000 173,000 34% (1990-2000)

> but still, almost twice as
>many licenses added in 1990-2000 as in 1980-1990.
>
Nope. Only 49% more - 57,000. Much of that is the result of the
change in license term to ten years.

>> I have a a 1984-85 edition of the ARRL Call Directory. Printed early 1984.

>book had a higher number, but it could be because the FCC kept expired
>licenses in the database until the grace period expired, and the ARRL
>book was drawn directly from FCC data.

Maybe. More probaly, though, is the fact that the FH books are printed at
the end of the previous year. (the "1984" FH book was printed in late 1983 and
so contains late 1983 numbers, not 1984 totals).
>

>
>> How do you compensate for the change from 5 to 10 year licenses, btw?
>
>No accurate compensation is really possible.

But an educated guess is possible. Here's an example:

Suppose that the average amateur "career" is 40 years. That means 2.5% of the
amateur population
drops out per year. (One ham in 40 goes inactive per year, IOW). At the level
of 500,000 hams,
that amounts to 12,500 hams per year dropping out.

Of course any individual ham's dropping out is not noticed in the totals until
the license expires. Under the
old system the totals carried 5 years worth of dropouts at any given time. When
the license period was
doubled, the number of dropouts in the system gradually doubled. This
"bubble" of dropped-out-but-still-licensed hams serves to inflate the total. At
the level of 500,000
hams and 2.5% annual dropout rate, the "bubble" was 62,500 with a 5 year term
and 125,000 with
a ten year term. Difference: 62,500 - MORE than the 57,000 increase noted
above. And that assumes
only one ham in 40 drops out per year.

>We should recognize,
>though, that the number of licences in 1990 is somewhat artificially
>high, since there were no expirations in 1989. That makes the growth
>in 1980-1990 look somewhat better than it is.

Yes - there's one year in those totals, but four years in the 2000 totals.

>And...
>
>> The
>> change occurred in 1984, which means that from 1989 to 1994 there were
>> NO US ham license expirations. Conveniently, most of that falls into the
>1990-
>> 2000 time frame.
>
>So did the burst of pent-up expirations in 1994.

NO!

There was NO "burst of pent up expirations" in 1994. 1994 saw the 1984
licenses expiring, that's all. The "bubble" continues.

> By 1995, things were
>back to normal.

No, not at all, unless you define "normal" as carrying a "bubble" of over
100,000
licenses.

>Of course, there are licenses that would have expired
>after 5 years but didn't until after 10. That makes the 1990-2000
>growth look somewhat better than it is. How much better? I dunno. Do
>you?

See above. The 2.5% dropout rate says at least 50,000. As the ARS grows, the
number grows even larger.

Add to this surges caused by things like changes in the vanity call rules and
renewal rules and it's a real mess. But it's a safe bet that at least 1 in 5 US
ham
licenses will not be renewed at the end of its term.
>
>> >Clearly, growth spurted after the 1991 no-code license came into
>> >effect. Do you really doubt that, Jim?
>>
>> Whenever the "price" of something is lowered, there is usually a
>> spurt of "sales". The important question is whether it's a transient
>> effect or a long term change.
>
>If the "price" stays down, won't "sales" remain stronger?

NO. The market becomes saturated. Look at what happened to computers, VCRs,
microwave ovens, etc. A point is reached where most "sales" are replacements,
not
first-time buyers.
>
>> I doubt that the 1991 or 2000 changes have/will result in longterm growth
>> changes.
>

>Nobody will ever be able to say for sure. It's impossible to isolate

It's possible to see the trends only after long periods of time.

> But the unsurprising pattern that seems
>to be common across the history of Amateur Radio is that each time it
>has been made easier to get and retain a license, growth has followed.

Paradoxically, growth has also followed when the requirements were made
HARDER!!

>It happened in the 50's after the creation of 5-wpm licenses.

The ARS grew from 60,000 to 100,000 in the 5 years between the end of WW2 and
the 1951
restructuring - when all licenses required 13 wpm and a General written right
off the bat.

>It
>happened in the late 70's and early 80's when the Bash books made it
>easier to pass the writtens.

The growth actually started back in the very early 1970s (compare the annual
totals from 1963 to 1983).
Oddly enough, growth stalled from 1963 to about 1970, then INCREASED after
incentive licensing was
in place (late 1968). Long before Bash, the trend was clear.

And not all hams used Bash books. I've never even seen one.

> It happened in the 90's with no-code.

Maybe. Maybe not. Other factors cloud the issue.

>There were other factors that played a part, but it's not unreasonable
>to think the correlation is causal.
>
>Here's a table of FH Callbook counts of new licenses issued:
>
>1980 32,692
>1981 34,373
>1982 40,371
>1983 30,505
>1984 27,610
>1985 31,207
>1986 25,942
>1987 41,649

Note the surge due to the change in the rules in 1987 - then the drop back to
near old levels.

>1988 27,139
>1989 40,972

Another surge - two years BEFORE nocodetest!

>1990 28,667
>1991 29,300
>1992 48,700
>1993 46,806

>Nope. But that includes the downward bump from the initial no-code
>expirations. Let's check again in a few years and see how it looks.

Which is why I keep posting the numbers on another thread.
>
>> How about these (from AH0A):
>>
>> Total new licenses from March 00 to Dec 01 (sum of all months from
>> April 00 to Dec 01): 33,856
>>
>> Total new licenses from July 98 to March 00 (sum of all months for
>> period of same length before April 00): 27,935
>>

>> Difference: 5,921 in 21 months
>
>That's about a 20% difference in growth rate, Jim, which isn't exactly
>negligible. And, by the way, it shows that the effect of the 10-year
>no-code expirations IS offsetting increased growth in new licenses.
>Again, the effects are relatively small and short-term and shouldn't
>be used to predict long-term trends.

The point is that the growth has not been very great despite massive rules changes.

The regulatory service under which the hams operated is irrelevant to the point that "hams" did indeed help develop the system. It is relevant however, to the need and to the regulatory restrictions.

Waffles anyone?

When the IRS asks you for your exact income, would a response such as "not
much" be what they had in mind?

Cecil did not ask about how many CW operators there were, he asked exactly
how many. That is an unanswerable question, which is exactly what he
intended.

I guess I can assume in this case that their lack of success is what led to
the characterization of these particular businessmen as
hobbiests/electronics buffs.

Ranges for high speed data are not limited to "the end of
the block" or less, as you seem to imply.

I believe I've mentioned before that I've run the link
budget calculations for a 6 mile+ path from my home
to my employer's closest facility and that WITH the
standard output power of +15 dBm from a standard
"client" device and 20" grid dishes at both ends of
the link, I'd have link margin to burn at 11 Mbps ...
thus assuring execellent reliablilty. If I were willing
to settle for, say 2 Mbps, I could use smaller, lower
gain antennas, extend the range, or some combination
thereof ...

Metricom was a commercial enterprise ... and the data
rates their system provided were nowhere near what
802.11b can provide ... I believe that their limited data
rate offerering was a key factor in their demise ...

Dennis, et al ...

I would agree to some extent that some of the content and
control restrictions have a discouraging effect on ham
development of high speed computer networking (under
Part 97, rather than Part 15 ...)

However, I also believe that changes in those restrictions
would need to be carefully considered to balance the need
for more flexibility, while still preserving the non-commercial
nature of ham radio and making sure that things like porno
sites could not be accessed.

However, I also think that limitations our our ability to provide
a robust backup to the internet access needs of the emergency
management agencies we serve in times of disaster should
be eliminated and that the ampr.org domain should become,
to the degree practical with *reasonable* restrictions, a much
more viable and vibrant part of the internet.

My my! With all of this clear headed logical thinking and
excursions of profound explanations flowing into the heads
of those young nubile FCC commissioners, (see p.16 Nov. 2001
QST), coupled with the fruit cake proclamations of the NCI,
I guess amateur radio is in good straits. What do you
think???

>
> Does a vanity license count as a NEW license?

I think it may count as a new license under the old FCC system.

Actually, not for sure it's one of them. My PCT2e generates FSK tones in
sideband mode where the carrier is suppressed for both mark and space. The
tone pairs are 1200/1400 Hz and 2300/2100 Hz.

A DSSS receiver needs to know the center frequency, Dick, just like SSB.

Nope, it's not, Dick. I speak from my Cub Scouts experience. My cousin and I made up two charts, one for XMIT (the normal one in the ARRL Handbook) and another for receiving which went like:

. E
.. I
... S
.... H
..... 5
etc.

The lookup chart for receiving is necessarily different indexing from the lookup chart for transmitting. I soon learned that I didn't have to look at the charts. But my cousin always used the charts. He could translate either way at 4wpm.

I hear many CW operators who don't know that a dash is supposed to be three times as long as a dot. I hear dashes that are five times as long as a dot. It doesn't matter. I can still read it.

Not if you have your way. However, when the code requirement is
dropped, those same havenot techs may indeed have an HF transceiver
and be able to participate in emergency communications. From what
you've said, you would rather nocode techs be deprived of an HF
transceiver during and emergency. That is right, isn't it?

> >Anyone with a lookup chart can send/receive 4wpm, Larry.
>
> Only if they've had previous off-the-air practice, Cecil.

When in cub scouts, my cousin and I started communicating right
away at about 4wpm using send/receive charts. It ain't rocket
science. At 4wpm, one can write down dots and dashes and translate
them later.

> >Would you respond to a 4wpm 'SOS'? Would you respond at

>
> Yes on both counts; but this isn't about me.

Of course it's about you, Larry. You have previously given the
impression that a 4wpm 'SOS' would fall upon your deaf ears.
Something like, they deserve to die because they don't know
Morse code.

Cell sites have to be pretty close together, Carl. I didn't think that
issue was in dispute.

There is only one other ham within 6 miles of my home, and we don't have
a lot of data we need to exchange.

Why, because you would refuse to respond to a 4wpm 'SOS'? 4wpm is easily
doable with lookup charts, Dick. I speak from experience.

I would guess that the APs (access points ... what I believe you
actually mean when you say "cell sites.") are probably closer
together than 1 mile in a dense urban environment like NYC.

So an answer such as greater than one, but less than a million would be
an exact answer - as far as Webster is concerned. Did you employ
similar such exactness at Intel?

DSSS runs "on a frequency" in the same way that SSB does ...
in a good DSSS system, the carrier is suppressed well below
the modulation content.

Using your "terminology" SSB doesn't run "on a frequency"
either (which is at least borderline rediculous), since the only
way it would be on a single frequency would be if only a single
tone were transmitted and the carrier suppression were infinite.
The first is of virtually no utility and the second is unachievable.

There are mechanisms for avoiding the "hidden terminal" problem,
or at least significantly minimizing it ... as has been said before,
there is no guarantee of absolute freedom from interference from
ANY other use of the same spectrum ... even from other users of
"legacy" modes.

> > However the same goes for "analog" systems ... in other
> > words, there is no excuse for the CW operators who key

> Internet. First the bandwidth simply isn't there under any
conditions.

You must be assuming the system will/must of necessity operate
at 2m using the TNC and voice radio paradigm ... that's exactly
what I'm suggesting we abandon because it doesn't work very
well.

> Second while packet ran well along the flatlands from the Carolinas

> the MONEY, not the technology which spanked packet into boredom.

I wasn't saying that we could "mirror" the entire infrastructure ...
only
that we can provide local service at high bandwidth and a robust,
portable capability to provide service within and bridge to the
outside
from disaster areas.

If you don't want to "play," fine ... but why try to "prove" that it's
impossible ... just to discourage others from getting involved
and actually doing it???

Having seen the information on the internet, I find it difficult
to believe that your mental filtering capacities are seriously
strained ... if they are, then we have a different problem here
and probaby shouldn't continue the thread because to do so
would be futile.

> So yes Packet lives on. And it NEEDS to be get FIXED dammit!

So let's talk about actually FIXING it ... rather than putting another
band-aid on a system that was poorly designed in the first place.

> Even a lousy 4800bps would have prevented those crashes. Nitwits . .
.

At least you've properly characterized 4800 bps :-)

Sounds fantastic. Guess it didn't work out for them though. Remind me
again why is it that hams should do the same thing?
```

I know that Dick Carroll will jump in here and say "It's irrelevant to
ham radio.", but check out Shannon ... DSSS systems (just one
form of SS, but they are what we've been mostly talking about
here in the form of 802.11b as an example useful for high-speed
networking) trade bandwidth for communications efficiency and
required SNR ... they have "processing gain".

> > How do you do that manually for the modes you operate?

"Carl's system" (though I'm not taking credit for 802.11b) operates
in a band where there is negligible use of narrowband modes, operates
at power levels FAR below what I'd be you operate CW at (even if
you're "running barefoot" ... even if you're "running QRP") and has a
much lower PSD (Power Spectral Densisty) ... you exaggerate the

potential for widespread interference.

I thought I said that ... (that the reverse was true as well ...)

> Humbug, see above wrt to the inheresnt nature of SS being
> "accidentally propagated" all over a large bandwidth.

There's nothing "accidental" about it ... SS deliberately
trades bandwidth for SNR performance and robustness
("process gain").

> Were you on 20 when the Soviets were experimenting with HF
> over-the-horizon radar Ed?

What the hell does that have to do with low-powered stuff
in the upper UHF or low microwave frequency range? I'm
not talking about stuff that offers world-wide ionospheric
propagation here .. why do you insist on trying to compare
apples to oranges?

>http://www.hotbabe.com on Amateur Radio?

If I'm interested in the technology of building wireless network infrastructure I'm not sure I care where the bits I'm serving are coming from or what they are. It's providing the service of moving bits that is the interesting part, the part you can learn stuff from, not being a censor. And I don't have to see downloads from hotbabe.com anyway, that's what encryption is for, and if I don't see them why would I care? IDing frequently in the clear is sufficient for interference mitigation purposes, what technical purpose is served by the encryption and content constraints?

I left a real job to build wired Internet services (my wife thought I was crazy) about 15 years ago because I was interested in learning what it would take to build a new kind of communications service that was useful to people. I can't remember ever worrying about which people it would be useful for, providing connectivity to as much of the world as possible for as many people as possible for as many applications as possible was what generated the traffic whose carriage was the point of the experiment. We learned by building very big, very full networks whose existance we could justify by the demand.

Back then the long distance transmission capacity was paid for by begging for government money (wired bandwidth is never "free"), which came only under the conditions of an Appropriate Use Policy concerning content. In fact no one, even the government, thought that AUP served any purpose with regard to advancing the technology, indeed it was explicitly intended to have just the opposite effect. The sole purpose of the AUP was to make the taking of government money so unattractive for those building stuff that you'd do whatever you could to wean yourself from that trough. It worked, too. The government(s) got a bargain for their early small investments in Internet technology because almost everyone wanted to get into a position to avoid taking that money.

It used to be that communications channels and their applications were inextricably tied. That is, if you wanted to talk you used the phone, if you wanted to listen to someone else talk you turned on the broadcast radio, if you wanted to send a short message you went to the telegraph office, if you wanted to send a long one you used the mail, and if you

wanted porn you went to a shop in a bad section of town and bought 8 mm
films. Then it probably made sense to reflect the non-commercial,
self-learning purpose of ARS communications channels in similar constraints
on the applications. Now, however, the art has advanced strongly in the
direction of building communications channels which are independent of
applications, i.e. the message has become independent of the medium,
but ARS AUP still leaves those interested in experimenting with the
medium responsible for intimate control of the messages along with it.
That isn't how communications networks are built now, so it is no
wonder that even hams interested in the technology run to another
service for their experiments.

>I suspect that most of the reasons that this is being done under Part 15 is
>that people who are not amateurs can use the network at will.

I meant "control restrictions" to imply this. The fact is that you
can only learn something from building networks if you have users of
the network, and you learn more and faster if you have lots of them,
so it isn't surpising that hams interested in this stuff run from rules
which restrict them to serving a tiny fraction of the population.

Why is it that the fact that the communications channel is being provided
on a non-commercial, experimental, self-learning basis, not sufficient
to allow this to be an amateur radio service? Part 97.1(a) implies that
providing service to the general public is fundamental to the ARS, yet
the regulations mosty prevent amateurs from doing so in a way the general
public would find useful. Does that make sense?

>I just find it a bit ironic that these systems, using "our" frequencies, are
>springing up outside of amateur radio. And when I told at least one ham they
>exist, I was out and out accused of lying. :-)

What you should be finding even more ironic is that many of the guys
using "our" frequencies outside of amateur radio are "us". Many hams
do this work, which isn't surprising since people with the interests and
skills to become a ham are often exactly the people with the interests
and skills to build a non-commercial wireless infrastructure.

I can see why you are a bit uncomfortable with this use of the frequencies,
however, since there is also some number of radio newcomers who are
self-learning, and being elmered, while participating in this aspect of
radio technology who in previous times might have done so by becoming
hams. Don't blame amateurs for this, however, since it seems to me the
amateurs involved are doing exactly what they're supposed to by contributing
their own expertise anyway. If you want to assign blame Part 97 might be a
better place to start.

>The hostility I have received from some for even discussing that hams should be
>doing more such technical experimentation and learning more about these modern
>radio technologies really suprised me.

I did notice that what one of the hostiles kept asking about was what the
problem was that needed solving, and I thought this was a particularly

relevant question. At one point you answered him with a pointer to a paper which demanded spectrum efficiency of amateurs to justify their allocations, which to me was non-responsive since spectrum efficiency isn't a problem, it is a solution to a problem.

If you want amateurs to be concerned with spectrum efficiency I think the only practical way to achieve this is by arranging for them to have congested spectrum. Yet right now the only way amateurs can congest their spectrum above HF is by using it incredibly inefficiently.

The cell phone companies understand spectrum efficiency because they sell cell phones to millions of people who put bits on the network, though the network itself is built and maintained by just thousands. The Part 15 experimenters are not numerous, but they try to make their networks useful to as many people as they possibly can by allowing anyone to use it and by adding an Internet connection to the back. If they're successful they'll learn a lot about spectrum efficiency as well. If I look at the ratio between network builders and network users you seem to need to congest the spectrum at the state of the art, I suspect there aren't enough hams with enough ARS-permitted applications within line-of-sight distance of each other to even come close.

If you want amateurs to develop state of the art spectrum efficient solutions they need to be having state of the art spectrum-efficiency problems. For this you need traffic, the same way we needed traffic in the 1980's to learn to build large wired Internet services. If you want traffic for your network you need to have users, and lots of them, and the best place to attract users is from the public at large, which doesn't care about the technology but might like to use it.

So I'd ask again, why is the fact that a communications channel is under a ham's control, is being provided and supported without pecuniary interest, and is maintained solely for the self-education of the amateur, not sufficient to allow the channel to be run under Part 97? What purpose is served by the Part 97 fixation with what the bits being carried mean, and whether they are "ham" bits or "not-ham" bits? As far as I can tell these rules were instituted mostly to protect the business interests of monopoly phone companies and PTTs which are long gone, yet the rules remain.

If the rules were such that an ARS license would provide you some advantage in building the networks they're playing with under Part 15 now there might be a few new hams. The fact is, however, that if you are interested in building such networks then Part 97 just gets in the way. It is still the case that there are a lot of other things you can do under Part 97, but if you berate amateurs for not doing this particular thing even though the rules make it utterly unattractive to do so then I can see why people might get hostile.

Dennis Ferguson

Dick,

Cecil's point, as written is technically correct ... anything
that modulates a carrier produces sidebands, thus it
has bandwidth and runs on more than just "a" frequency.

DSSS signals, which is what we've been talking about
like SSB, also have a carrier frequency, but like SSB,
the carrier is suppressed. 802.11b channels are defined
by that suppressed carrier (or center) frequency.

Do you operate at all at 2.4 GHz? If not, why do you give
a crap? Oh, you're just trying to find someone and some
excuse to take shots at them because that's become your
major form of entertainment? (I thought so ...)

I would argue that, since FSK is "digital FM," the (conceptual)
carrier frequency between the mark and space tones could be
considered the "base" frequency.

> SS signal
> occupy a range of frequencies +- of the carrier or the center
frequency of the
> occupied channel.

True ...

> A non-SS signal at a data rate equal to the speed of the PN
> encoding would occupy essentially the same bandwidth of the
> DSSS signal.

Not necessarily so ... if you had said "symbol rate" I'd have
not said a word, but symbols can be "overloaded" and the
delivered data rate can be quite a bit higher than the symbol
rate ... M-ary FSK or PSK, the various M-ary QAMs, and OFDM
are some examples where the data rate can exceed the symbol
rate.

As an example 802.11a (at 5 GHz) uses OFDM and can pack
54 Mbps into a channel considerably narrower than what you'd
get if you had a 54 Mbps PN sequence and DSSS.

>What is the difference?

The difference (that the original question was referring to
before I put the previous 2 paragraphs in) is that there is
no difference ... and the issues are probably irrelevant to

anyone who doesn't use the bands where this sort of gear
would be deployed ... thus, all of the "you'll screw up things
for us CW operators" arguments are little (or nothing) more
than those CW operators ranting against anything that's not
CW ... whether they use the bands involved, or ever will is
not relevant ... they just want to argue against anything new
because it's, well ... new (at least to ham radio).

I think word of mouth does just fine, except we hams don't take the
responsibility enough. I would rather *not* have the HQ of a national
organization be the outreach. They have other more important things to do.
The best use of time is to have all hams on deck for outreach.

I totally disagree for reasons stated above. I don't want my ARRL
membership dues spent for stuff that may be placed in those ads that then
leave me no other option but to talk about or defend when other people ask
questions. Know how long it took to "live down" the movie Frequency? (It
was basically viewed as a bad comedy by people who had learned I was a ham
and would then ask me all about that movie.)

And, I agree with Ryan. The future of ham radio is quite intact and doing
well.

It is more accurate to say that hams helped develop some of the systems.
Perhaps it is more relevant yet that they did so for the use of non hams.

You have it confused, it's Little Dick, Dickie. And, a conversation by any other name is a conversation. You complain of people who use semantics, yet what have you just done. Think about it, it might take some time. Now, if you're not having conversations or QSOs with other people, then what *are* you doing with your radio. Turning it up loud enough to get a vibration?

Is that not offset by the fact that the spread spectrum system puts less energy into any given narrowband channel than you do when you operate narrow band at the same power level? For the 20 MHz SS devices being discussed here, the ratio is 30 dB for SSB bandwidths.

>Were you on 20 when the Soviets were experimenting with HF
>over-the-horizon radar Ed?

Yes, I was. As I recall, they occupied about 10 kHz of spectrum, found for minutes at a time on different parts of the band.

Yep, you got it. I asked that of Jay here a bit ago. It seems the hate and contempt from people like Larry, Dick, etc., leave one to truly wonder what values they place upon their effort (or not) to help someone.

You're right, Cecil. I get the distinct impression, also, that some would just as soon let others die as acknowledge a signal beneath their expectations. But, it's kind of like when I hear crappy people talking about how *they* went to war for my freedom. I like to remind them that they went to war to win freedom for people who think like them, so they could come back home and tell everyone how they should think. With soldiers like that fighting "for me" who needs the enemy?

I disagree.

It's clear that the FCC had already decided against code testing long before the NPRM was issued. The medical waiver headaches alone were enough reason for them to eliminate all but the minimum. FCC ignored the majority opinion as if it were not there. Would having a larger majority have changed their mind? Nope.

FISTS wisely stayed out of the fracas, knowing that taking a political position

would only divide their membership. Note that FISTS and the ARRL did encourage all to express their opinions direct to the FCC.

FCC has been pushing for the end of code testing since 1975.

Sure it does.

>The test is about qualifications, not about love.

The word "amateur" derives from the Latin word meaning "love". To be
an amateur is to do something for the love of it. Amateur radio is all
about love, so it's logically part of the test requirements.

Just check your dictionary, Cecil.

>The FCC has decided
>that a 5wpm Morse code exam is a sufficient qualification presently.

Actually, they've decided that the ONLY reason to test at all is S25.5.

>If S25.5 is repealed, the FCC will have to decide if an amateur
>radio operator is qualified without Morse code.

Read the R&O to 98-143. They've already decided. By the look of things,
they decided long ago.

It all depends. If you were on 40 meters, you might run into the chucklehead I did some 35 years ago. He built an amplifier from a kit. Left off the tube covers so the tubes would 'run cooler'. Also left the metal cover off the amp so it would 'run cooler'. The real culprit was the speaker leads which ran parallel to the offending dipole in the next yard. I didn't measure them, but they were quite long. About 25 or 30 feet long. Change your frequency and you'll find some other device which picks up the signal. On 40 meters, you probably wouldn't have a problem with your speakers; you might, however, have a problem with a neighbor's sound installation. BTW, I had a 900 MHz spread-spectrum cordless phone which interferred with the doorbell. Replacing it with a 2.4 GHz spred-spectrum cordless phone solved the problem. Doorbell. Go figure.

Frequency, by convention, is specified as the 'mark' frequency even though
the transceiver frequency is 1.4 kHz higher or lower. It doesn't do anyone
any good for me to tell them what frequency my transceiver is on if I don't
also give them give them the offsets for the tones which are programmable.

> drops out per year.
> (One ham in 40 goes inactive per year, IOW). At the
> level of 500,000 hams,
> that amounts to 12,500 hams per year dropping out.

There are a lot of "ifs" involved there. IF the 40-year average is
correct and IF hams got their licences at a constant rate. But of course
the growth spurts of the last 20 years bias the population toward those
who have been licensed for far shorter periods of time. So even if your
40-year assumption is correct -- and who knows? -- the 2.5%/year figure
should be lower.

One of the irritating things about trying to do these analyses is that
there are substantial year-to-year variations. They make using
estimates -- averages in particular -- little better than using random
numbers. I stand by my opinion that it's impossible to make a

sufficiently accurate estimate of the 5/10 effect to factor it out of the total number of licensees. It's much better to look at the rate of new licensees.

>>If the "price" stays down, won't "sales" remain stronger?
>
> NO. The market becomes saturated. Look at what happened to computers,
> VCRs, microwave ovens, etc. A point is reached where most "sales" are
> replacements, not
> first-time buyers.

There are no "replacement" licenses. (Well, a few lapses that get relicensed.) All new licensees represent additions to the ARS. If a change makes the license appealing to x% more of the current population, it should also be appealing to x% more of the future members of the population (than it would have been without the change).
That represents a sustained difference.

>>> I doubt that the 1991 or 2000 changes have/will result in longterm
>>> growth changes.
>>
>>Nobody will ever be able to say for sure. It's impossible to isolate all
>>of the factors long-term.
>
> It's possible to see the trends only after long periods of time.

But it's impossible to separate the factors that create the trends. Changes in the licensing system don't occur in a vacuum. Which do you think affected the growth of ham radio more in the past 20 years: A) licensing changes, B) reduction in the amount of leisure time working adults have, C) the Internet, D) cell phones. How do you tell?

>> But the unsurprising pattern that seems

Yep, in part because a lot of military-trained radio ops got their tickets. Another example of a factor that has nothing to do with licensing muddying the analysis.

> The growth actually started back in the very early 1970s (compare the

> in place (late 1968). Long before Bash, the trend was clear.

Maybe you could cite the numbers you're using? Because that's not what
I've seen. AFAIK growth was flat from the mid 60's to the mid 70's.

> And not all hams used Bash books. I've never even seen one.

Not all, but quite a lot did.

>> It happened in the 90's with no-code.
>
> Maybe. Maybe not. Other factors cloud the issue.

They do, but not so much that the no-code effect can't be seen.

What you are citing are large year-to-year variations. Trying to
assign reasons to them is futile. You have to look longer term.

>>1990 28,667
>>1991 29,300
>>1992 48,700
>>1993 46,806
>>1994 50,316
>>1995 57,154
>>1996 48,727
>>(The 1997 Callbook, giving 1996 licenses issued, is the last one I have
>>handy at the moment.)
>

>>Notice the immediate and sustained increase in growth rate after the
>>1991 no-code changes.
>
> Yes, there's an increase - but is it sustained? Note the drop in 1996.
> What happened in
> following years?

Again, look at the long term. Up to 1991 the growth rates were mostly in the high 20k to low 40k ballpark. After 1991 they were in the high 40's to low 50's for at least 5 years. Even with the significant year-to-year variations there was a clear step up post-1991.

>>And these numbers can be in no way biased by the 5/10 year term change
>>since they are NEW licenses.
>
> Does a vanity license count as a NEW license?

Vanity gate 1 opened in May 1996, so that's a moot point WRT the above table. In any case, no, they aren't new licenses. For example, just to pick one at random:

HARE JR, EDWARD F, W1RFI (Extra)
304 GEORGE WASHINGTON TPKE
BURLINGTON, CT 06013
Previous call sign: KA1CV
Licensee ID: L00144311
FRN: 0003606456
Issue Date: Mar 27, 1997
Expire Date: Mar 27, 2007
Date of last Change: Mar 27, 1997

Note the previous call sign.

> In other words, hams who got nocode tickets are more likely to drop out
> than their predecesors.

No, ALL newbies drop at a higher rate. The first renewal is less likely than the second one. That was just as true for those who got renewable Novice licenses.

>>> Exactly. But we are to believe without challenge claims that code
>>> testing is/was "crippling" amateur radio. Sorry, I don't buy it.
>>
>>Who said that? Not me.
>
> Read Carl's brag signature.

So? He's wrong. Go argue with him about it.

> The point is that the growth has not been very great despite massive
> rules changes.

It has changed, though. Greatly? Perhaps not. The unknown factor is what the growth would have been had those changes not taken place. You assume

it would have been what it was before the changes. That's possible, but it's also possible that growth would have slowed or stopped. Nobody can say for sure. Some of those who argued for those changes did so on the basis that the changes were needed to sustain existing levels, not to increase growth. They'd probably argue that without the changes, ham radio would have undergone negative growth. Of course, they can't prove their case either.

Ideally, of course, changes to the licensing requirements and privileges should be evaluated on the basis of their fitness to purpose, not to establish a growth rate.

I suppose I shouldn't expect you to hold to any accuracy yourself.
You know that anyone who never before sat down to a key will not be able
to form dots and dashes without some minimal training. That means he
couldn't be expected to send message traffic using a lookup table since he
can't even yet form the characters. He'll almost certainly send dit
ditditdit dit dit etc. Just like your examples-not a dah in the lot!
The CW ops you hear on the air certainly have not just sat down to a key
for the first time. They have learned how to form characters.

Your character was formed long ago, and such a poor job of it!

Hams are free to love ham radio to their heart's content. But, to the
best of my knowledge, nowhere in part 97 does the word "love" appear.
Love has no place in objective governmental requirements and the FCC
does not love amateur radio.

I on the other hand speak from the experience of having taught the code to a number of classes, beginners all, who had no prior experience whatever at sending code. Invariably they would send all dits, trying to space them to form words and not realizing there is two distinct characters, and first had to be carefully taught how to form each character-both dits and dahs.

Your cub scout experience was so long you likely don't recall the specifics. You had to learn the same thing.

The "monopolistic" companies may no longer exist "out front"
but the industry as a whole does and is very protective of
their position, rights, privileges, and status (read: money)
and if you think for one minute that they are going to yield
any of that to an anarchistic model you are sorely mistaken.
The only thing that keeps them quiet about the Internet as it
exists today is that they charge big bucks for the backbone.

So the problem is Part 97, is it, and the solution is to change Part
97 to allow the "free range" regulatory model that you advocate?

This is the same argument that Stephen Dunifer used in his
defense (see US v Dunifer, N, Dist of Cal, 1996) to run his
pirate FM station as against the regulatory authority of the
FCC, the Communications Act ("free speech means I don't need a
license") and Parts 15 and 73 of the Rules ("if Part 73 doesn't
provide for a license class where I can run the power that I
want, I'll just run my station without FCC oversight"). After
2-1/2 years of testimony, submissions, and agonizing over this,
Judge Wilken finally issued the injunction against his operation.

(I can give you more details of that case than you really want - I
was the FCC's case supervisor and it's burned into my psyche.)

There's more to this issue than the purely technical aspects. What
it boils down to is if one wants to play the game one follows the
rules. All the rules. And the FCC is the rulemaker and the
decider which rules may/must be changed.

I for one have no problem with the control and content rules as
they stand. It DEFINES amateur radio's disctinction from other
services, giving the basis for allowing the experimentation,
not the other way around.

No, I don't and don't plan to. I don't care for talking to myself.
Don't worry too much, you won't be on that band as a ham too much
longer, either, unless the commercials who want it (you?) are generous

enough to allow hams to share it. I doubt it. I *don't* doubt they'll
have it bought sometime in the not too distant future.

>Oh, you're just trying to find someone and some

> excuse to take shots at them because that's become your

Little early stage Alzheimers, Cec? Use the spice tumeric, it cancels out the
protein that causes it.
Larry was right "This isn't about me". It's about all those codehating
pseudohams who you insist will instantly "learn" the code, when they need it.

They won't *instantly* learn it but they will learn it if they need to.
Look at it this way. When we have a nocode general license, there will
be more operators available for emergency HF communications. Some of
them will choose to have CW in their bag of tricks. One doesn't have
to have a license to learn Morse code.

Nor is the first; there is always some residual AM, FM or PM noise on
any carrier. In practice, either can be achieved to an acceptable
level. Of course, the first is still of very limited utility.

> There are mechanisms for avoiding the "hidden terminal" problem,

Which of the current spate of commercial SS standards contains such
mechanisms such that if I call CQ on a channel in the middle of the SS
channel, my frequency will be clear shortly after I start?

And none of them have any provision for clearing the channel if the
ham who might otherwise answer my CQ hears the SS station, but it
doesn't hear me.

Of course, that problem also exists in narrowband communcations.

Imagine how cool it would be if hams could easily send images to and
fro disaster areas. Imagine how way cool it would be if hams could
get those images to other parts of the country quickly.

On the ISP-wireless reflector, some of the WISP folks talk about 20+ mile links using Part 15 equipment. In some cases, however, they are talking about using 1 watt of power (legal for up to 6 dBi of antenna gain on 2.4 GHz) and higher gain antennas -- not legal. On 2.4 GHz, the power needs to be reduced by 1 dB for every 3 dB of antenna gain over 6 dBi.

Hams would not have that restriction if they used unmodified Part 15 equipment on the lower part of the Part 15 allocation, entirely within the ham band. At 1 watt, amateur antenna gain is unlimited and power-control of the Amateur station is not needed. If memory serves, hams can amplify that 1W up to 100 W, but over 1 watt, power control is needed to maintain a maximum bit-error-rate.

But under ideal conditions, stock Part 15 equipment is easily capable of communicating for miles.

It's about the love of all radio, Cecil.

> But, to the
> best of my knowledge, nowhere in part 97 does the word "love" appear.

Doesn't have to. The word "amateur", being based on the word for love,
says it all.

> Love has no place in objective governmental requirements

"objective governmental regulations" is an oxymoron. You know, like:

tight slacks
nondairy creamer
jumbo shrimp
business ethics

> and the FCC does not love amateur radio.

That last part is obvious.

But if you say love has no place, than you must think the regulations are
based on hate.

Since I don't claim to be an expert on all possible versions
of SS radio systems, I'm aware that there may be some Carl
Stevenson brainstorm that uses an entire band of frequencies
equally as its base. I think it's been adequately demonstrated
that there's a few things I don't know. I'm not supposed to
know everything.
How about you?

Well a HT on the belt sure won't do it. You might want to get the no code techs on board.

What ever happened to slow scan TV? I know, relatively poor image quality. But the commercials have already trumped us with the satellite video phones anyway, as shown by news clips from Afghanistan.

> Imagine how way cool it would be if hams could
> get those images to other parts of the country quickly.

That should be a snap. Adapt technologies already in use. Sending a compressed .jpg file from your digital camera using a digital HF mode should be easy enough.
Getting something like that coordinated, up and running is the sort of thing the ARRL should be good at. Why aren't they?

>
> There are a lot of "ifs" involved there.

Are any of them unreasonable? Sure, some hams are licensed as teenagers
and make it to their 90s. Others lose interest in a license term or two.
The point is that a certain percentage of the amateur population simply
loses interest every year and abandons ham radio, but that loss is not

reflected in the license totals until the license expires or is cancelled.

> IF the 40-year average is
> correct

Yup. 50 year average would be 2%/year.

Better yet, express it as "how many licenses held today will not be renewed?"

> and IF hams got their licences at a constant rate.

Nope. That makes no difference - all that matters is the dropout rate.

One ham has a 70 year "career" and another has a 10 year "career" when their licenses expire. Average is 40 years.

> But of course
> the growth spurts of the last 20 years bias the population toward those
> who have been licensed for far shorter periods of time.

So? All that matters is the droput rate. Note that many new licensees are older folks, who probably won't be hams for 40-50 years, unfortunately.

> So even if your
> 40-year assumption is correct -- and who knows? -- the 2.5%/year figure
> should be lower.

I don't think so. Look at the AH0A expiration data and grace period renewal data.
>
> One of the irritating things about trying to do these analyses is that

I disagree. If you average over enough years the trend shows up.

> I stand by my opinion that it's impossible to make a
> sufficiently accurate estimate of the 5/10 effect to factor it out of the
> total number of licensees.

It still must be considered. Suppose the dropout rate is just 1.5% per year (average ham "career" 66 years!) - based on 500,000 hams we get 7,500 per year, or 37,500 in 5 years.

> It's much better to look at the rate of new

> it should also be appealing to x% more of the future members of the
> population (than it would have been without the change).
> That represents a sustained difference.

Let me explain. The following are just my terms, but they should be clear enough.

For any product, there exists a potential market of a certain size. This potential market is the set of everyone who wants the product.

A subset of the potential market is the actual market, which is everyone who will actually buy it at a given price level.

Lowering the price makes the actual market a higher percentage of the potential market.

But there comes a point where the market saturates. For example, consider refrigerators. When they were first introduced, nobody had one, and the market for them was huge. Eventually almost everyone had one, and sales consist mainly of replacements of old refrigerators and population growth.

Lowering the price of a fridge won't increase sales much because most people who want a fridge already have one. Mine is a little over 2 years old, for instance, and I have no need for another, nor any place to put it.

With ham radio licenses, saturation occurs when everyone who wants a license already has one. Lowering the "price" won't have much effect on the numbers.

>
> Not that I'm aware of. Details?

The greatest period of growth in US amateur radio was in the Great Depression.

The number of US hams almost TRIPLED from 1929 (~16,000) to 1934 (~46,000) even though the written tests were made tougher and the regulations were much more restrictive (the "1929 regs" required much better signals from ham rigs and narrowed the bands enormously). On top of this was the depression itself.

> licensing muddying the analysis.

There was also a housing shortage, a baby boom, and tremendous upheaval in the postwar era. TV, the GI bill, and new careers and families starting up. Yes, some hams came from returning GIs, but many prewar hams lost interest during the 4 year shutdown - or never came back at all.

Point is that the growth before and after the Novice and Tech licenses was not much different. The big change was that new hams were, on average, younger.

There would then be no "pent up expirations", because post 1991 Techs would be
just as likely to drop out as pre 1991 Techs.

Emotions are never irrelevant. They are the reason we do things. They are the foundation of all value judgement, which are the most important judgements we make. And the regulations are seldom if ever objective.

> Love and
> hate are imaginary 'j' terms 90 degrees out of phase with objective

They are the driving force, the reason, the cause. The regulations follow them. Otherwise it's cart before the horse.

Better to be driven by love than hate.

They are where governmental regulations are concerned. Otherwise, we
will revert to having people executed on the whim of a member of the
Royal Family.

The FCC doesn't care if you love or hate amateur radio. If you meet
the requirements, that's all that matters.

>> and IF hams got their licences at a constant rate.
>
> Nope. That makes no difference - all that matters is the dropout rate.

Sure it does. If the average length of term is 40 years but most current hams have been licensed within the last 10 years, there won't be as many dropouts in the near term, all else being equal.

>> But of course
>> the growth spurts of the last 20 years bias the population toward those
>> who have been licensed for far shorter periods of time.
>
> So? All that matters is the droput rate.

The point is that the rate isn't constant. How could the dropout rate be constant when the entry rate isn't? Now, if you're applying the average across a really long term, fine. But you're not.

>> One of the irritating things about trying to do these analyses is that
>> there are substantial year-to-year variations. They make using
>> estimates -- averages in particular -- little better than using random
>> numbers.
>
> I disagree. If you average over enough years the trend shows up.

If you average over enough years multiple trends superimpose on one another and you can't separate them. That's what makes it hard. The short-term changes are highly variable and the long-term changes are due to multiple effects.

> In another post I showed AH0A's data for new licenses from 1998 to 2001.
> Not pretty.

Yep, things have dropped off the past few years. No question about that. Which only shows that the changing licensing terms is no panacea. Other factors are as, of not more, important to growth.

> With ham radio licenses, saturation occurs when everyone who wants a license
> already has one. Lowering the "price" won't have much effect on the numbers.

I've heard it put thusly: "If you walked around Times Square handing out ham tickets, not everyone would take one."

But the question is whether/when that point is reached. Until that point is reached, the effect remains.

>> But it's impossible to separate the factors that create the trends.
>> Changes in the licensing system don't occur in a vacuum. Which do you
>> think affected the growth of ham radio more in the past 20 years: A)
>> licensing changes, B) reduction in the amount of leisure time working
>> adults have, C) the Internet, D) cell phones. How do you tell?
>
> I agree that it's hard to tell the contributions from each cause. I would
> also say there are more causes than you list!

Absolutely, Those four are off the top of my head. But I contend that
each of them is significant enough to muddy up the trend lines.

>> Maybe you could cite the numbers you're using? Because that's not what

No, we don't have your QSTs at HQ, we have our own. :-)

> There was an interesting editorial about 1963 or 64 about the sudden end of
growth.

What would that tell us about growth the the late 60's and early 70's?

>> > And not all hams used Bash books. I've never even seen one.
>>
>> Not all, but quite a lot did.
>
> How many? When did they appear?

I don't recall exactly, but many of the folks in the DC area in the late
70's and early 80s, when I lived there, were unabashedly Bash users.
(Sorry about the pun.) And the availability of the Bash books, along with
the FCC's unwillingness to do anything about them, were one of the
motivations for the VEC system that began in '84. That wasn't the only
factor in the growth during that period, though. Another was that the
CB boom brought a lot of people into contact with two-way radio
communication. Naturally, some of them went on to become hams.

> It is interesting that you say they made the writtens easier to pass. Many
> here on rrap say publishing the Q&A made no difference.

Bash was publishing a much smaller pool. Size does matter!

You might need to remind, Jim, of what it is again that *you* think I should be afraid of? Dick's bought into the concept that the end of the ARS was eminent, due to Restructuring (as it's called). I don't know of any particular thing I've bought into on this newsgroup. Do you?

Whoops, forgot to send the reason why I said an HT will work just fine:

From the Kenwood website (I believe there are even other mfrs. who have equipment with this same capability). Dick, if you'd start having conversations instead of whatever it is you do on ham radio, you might have known this:

PS--Note the last feature at the bottom: "Accepts input from other camera or video devices"

Amateur Radio >> Portables >> VC-H1

Kenwood does it again! The VC-H1 is an all new exciting product to enhance your Amateur radio hobby. Compact and easy to use, the VC-H1 is compatible with all FM VHF/UHF transcievers along with FM and SSB HF modes. Send and receive digital images quick (17 seconds download @9600 baud) and easy anywhere. For camping trips, Field Day, or Disaster Communication teams. Imagine sending images across town or across the world on VHF/UHF or HF. The VC-H1 integrates with your PC to store and label all your favorite images for future transmission with special software.

Small and compact
AA alkaline or 110 volt AC adapter operation
Operates all Slow Scan modes
Callsign superimpose
10 picture memory

Auto Power Off
1.8 inch color display
Built-in speaker and microphone
Transmits to another radio and PC (w/ special software)
Removable head
Accepts input from other camera or video devices

Yes there is, let the wideband users have this chunk of spectrum space
and let the narrowband users have this other chunk of space, don't mix
'em, then there is no interference in the context of the extant
discussion and the whole thread becomes moot. And "dynamically
allocate" the sizes of the chunks based on the number of individual
users The System detects at any given point in time. That oughta ring
yer chimes.

Hogwash. Hey Sweetums I got a clue for you: I am very decidely NOT in
opposition to the implementaion of wideband modes in ham radio at all.
In fact I find it a bit appalling that, given the tools and talents we
have today in ham radio it still no wide modes have been implemented
yet in at least in some seminal experimental form or another. I am

however vehemently opposed to your "visons" as they relate to how wide modes should be implemented. And so is everybody else with half a brain and which is what this thread is is all about.
>

OK, so you just finally got yer free pass to HF, thus I'm obliged to make some allowances for your lack of experience and yer Coefficent of Stupidity as it relates to packet-assisted HF dxing and dx contesting with or without packet in particular. And how the packet system is integrated into contest logging software and computer-based station contol. And howcum there are only miiliseconds per packet post to do any "mental filtering" of the spots when yer running 150/hr. The Internet spots embody the concept of unmanageable futile data overload and endless searching. The packet spots on the other hand filter the futiles off yer screen by the megabyte and cuts to the quick right here and now, nail that new mult on 15 which shows up in the spots window, smack it with ye mouse, log him and back to yer run on 20 before yer pileup had a clue ya even left 20.
>
>
If perchance you have a problem with any of the above I can point you to several dx contesters who are almost in your back yard who can straighten you right out real quick. They've been doing the whole nine yards for years.
>
>
> So let's talk about actually FIXING it ... rather than putting another
> band-aid on a system that was poorly designed in the first place.
>
>
I know what the fix is and "we" don't have to reinvent the wheel or come up with SS sub-bands to get there. The problem is not the baud rate. The problem is using $100 Radio Slack 2m FM voice xcvrs which distort the hell outta data streams with their mic and speaker-driver circuitry. Boogered waveforms,
the checksums don't add up, "send again", and there goes the throughput rates. I've just now been apprised of the fact that there are current-tech 2m xcvrs starting to show up with "data ports" which jump past the mic circuitry for one and should reduce the number of tries before a handshake happens so given some time those radios oughta goose up the throughputs and fix the problem.

To state that "Spread spectum doesn't run on a frequency" then state later that it does is to correct your own wrongful insinuation. The readers know. No further quotation necessary.

Ah, really. And which royal family do you plan to import for the job?

You completely misunderstood the concept, Dick. Only an unmodulated continuous wave runs on a (single) frequency. CW does not run on a single frequency. SSB does not run on a single frequency. SS does not run on a single frequency.

Any signal with modulation information on it runs on a *band* of frequencies, i.e. it occupies a certain *bandwidth*. But most modulation methods use a (single) *reference* frequency including DSSS.

So, then, you're saying that it is impossible to effectively employ CW during post-disaster emergency communications? Or that it is unlikely that CW would be utilized by hams in a widespread disaster scenario?

My guess is that CW isn't used in emergencies very much because in most ARES/RACES groups, the code-proficient hams are generally displaced by the HT and microphone-slinging Ham Hero types. However, if a situation existed where CW really would be the only way to make contact with the "outside" world, very few hams would have the ability to effectively exploit this mode. Oh, I forgot. There's the "dot and dash" chart on the wall of the ham radio station in the EOC. Never mind.

What "mean and nasty" things might that be, Ed? I don't "defend" the CW mode -- I just point out it's benefits and advantages. I also indulge in slam-dunking lazy whiners who want full amateur HF privileges without having to be bothered to learn a practical communications skill.

>I am sure Carl considers you NCI's best friend. :-)

NCI doesn't need me for a friend; there are enough lazy, whining, knuckle-dragging droolers who want to get their hot little hands on an HF microphone to make NCI's job comparatively easy. Uh oh. I guess I just said something "mean and nasty." Sorry if the truth hurts anyone who saw it.

By jove! Finally something we agree on!

3843. Ham ops report on our Wireless Video Sender/Receivers

Newsgroup: rec.radio.amateur.policy
Date: 2002-02-08 08:48:26 UTC
From: CLOSEOUTS <oshea4@mindspring.com>
Message-ID: <a3vhq2$sj5$1@nntp9.atl.mindspring.net>
Source record: 33389

We have been getting many orders the last week from HamTV customers. I am including some reports written by the Ham Ops about
our units. I really do not know anything tech about our units, I have been in busniess since 1975 in Kansas City Missouri,
I am in closeout business. I own 4,000 Startech Video Sender/Receivers $30 + shipping. www.oshealtd.com

> Preliminary report:
> > I received a Star Tech 910XT-XR Video Sender thanks to Bill Houlehan at Oshea Ltd. to take apart and see how best to apply it to ATV. These units are FCC Compliant for license free use on 909.25 MHz and at $30 + shipping are
> well worth it for just that application. For ordering go to the web site:
> > www.oshealtd.com
> >
The transmitter and receiver (actually a crystal controlled downconverter) is designed for plugging in camcorder or VCR composite video and line audio to the AM transmitter (RCA phono jacks) and receiving through the downconverter with the F jack cabled to the antenna jack on a TV set to channel 3.
The system comes with screw in 1/4 wave spike vertical antennas and 12Vdc @ 200 ma wall plug power supplies.
> >
The power supplies actually put out 14 to 15 Vdc. In the transmitter, a 12V regulator IC is used, but in the receiver they just used a series dropping resistor. In either case, 12Vdc battery power could be tapped in on the output side of the regulator and resistor for portable applications, or directly from a car with the engine running.
> >
DX with the FCC Part 15 video devices is only a few hundred feet line of sight. You can't change the antennas or tweak the power for legal license free operation, but if used as a ham for ham purposes, you can repeak
the transmitter, remove the antenna system and connect to beams like the 3318LYARM Loop Yagi and should get about 1/2 mile line of sight. There are many public service events or other applications where this may be all you need. However for higher power a Downeast Microwave amp could be added - they have amps that take 10mw input, but more investigation of the transmitter needs to be done to better match the AM linear input range.
> Bill is trying to get the schematics for me.
> >
I think the best part of the Star Tech system for ham use is the crystal controlled downconverter. The downconverter outputs on channel 3, has a

preamp stage and a total gain of 18 dB. However, for some reason, the
local oscillator is on the high side which inverts the sideband. This is
no problem for simplex but if used to receive an ATV repeater transmitting
VSB, the desired VSB will be attenuated. It looks like just changing
frequency or going to low side injection should be as easy as putting in a
new crystal and repeaking the two triplers -
that is what I will try next. The crystal frequency is input frequency
input minus 61.25 MHz (ch3) all divided by 9. Crystals can be ordered from
KWMfg.
> > (405 567-2285) - specify KW-18 type crystal and the frequency:
> > 910.25 = 94.333 MHz
> > 911.25 = 94.444 MHz
> > 913.25 = 94.667 MHz
> > 919.25 = 95.333 MHz
> > 923.25 = 95.778 MHz
> >
The transmitter puts out -7 dBm pep which is about right for the 50 mW per
meter at 3 meter license free FCC Part 15 limit these units are
certified for. I was able to get about +2 dBm with a little peaking of the
output filter and some of the multiplier stage trimmer caps. However, the
tuning of the multiplier stages greatly affects the video modulation. I
could get +8 dBm if I just peaked for max power, but the modulation was
unuseable. It looks like they modulated the last tripler stage transistors
base. The video also rolls off quite a bit. The modulator is the weak
part of the design.
If I can get a schematic soon, I might be able to find a simple solution.If
not Ill just have to trace it out when I can get time.... and patience.
The sound subcarrier is also down about -25 dBc, which is quite low - it
should be up around -15 to -18 dBc, but this might also be a function of
the modulators video high frequency roll off. There are internal video and
line audio gain pots on the board.
The frequency can also be changed from 909.25 MHz by changing the crystal
and repeaking to the more standard ones used for ATV. The crystal frequency
is
> > times 9 in this circuit and the same type as in the receiver.
> > 910.25 = 101.139 MHz
> > 911.25 = 101.250 MHz
> > 913.25 = 101.472 MHz
> > 919.25 = 102.139 MHz
> > 923.25 = 102.583 MHz
> >
> > Both units are in metal enclosures with the electronics in tin plated
metal cans inside. The cans come out by removing the 8 external screws and
on the receiver, also removing the nut on the F jack. The cover on the can
comes off by prying up the tabs. The antenna assembly can be unsoldered
from the boards and replaced with coax and/or N connector for ham use.
> >
The receiver draws 40 ma and the transmitter 100 ma with 12Vdc applied.
>
> The receiver channel 3 output has a multipole bandpass filter which is

tuned by C20, 21 and 22. For some reason, it was centered on 61 MHz rather than tuned for being flat across channel 3 - 60 to 66 MHz. The high side at 66 MHz was rolled off about 5 dB which would decrease the color and sound subcarriers. A slight decrease in capacity on C20 and 22 brought the passband up to the proper bandwidth and band pass for channel 3. After a little more peaking I was able to increase the total gain to 22 dB.

Below, is another response about article above:

Thank you. Great, he is on the right track and we found all to be as he stated. I will order up a crystal for our desired frequency. Our plan is to operate simplex -- not a problem . Will keep you posted on our findings. Will also check on other hams who are working in The 900 MHZ spectrum.

3844. Part 97 Question

Newsgroup: rec.radio.amateur.policy
Date: 2002-02-08 12:30:32 UTC
From: qrp5@my-deja.com
Message-ID: <cce22972.0202080430.6e99dfc4@posting.google.com>
Source record: 33255

Concerning the transmission of an amateur station by an unlicensed person with a properly licensed "control operator" present, we have come to some disagreement lately. Some say the "guest" can operate the station, making calls and identifying with the callsign of the control operator. Others say the guest cannot INITIATE a call, and may not IDENTIFY with the callsign of any other person. We have looked for this specific situation in Part 97, but weren't able to find anything specifically on this. Can anyone point me to the proper clause (if it does indeed exist)? Thanks for your help.
Respectfully, JJ

>Respectfully, JJ

My understanding is that the control operator would have to be present
at all times when an unlicensed person is operating the station - and
that the control operator's callsign would be used.

As far as I'm aware, I know of no regulation prohibiting a guest
operator from initiating contact or from identifying the station using
the control operators call.

You also say that newcomers are more likely to drop out, so the two trends
oppose each other. 40 years is an educated guess - run the numbers with
50, 60 or 70 years and see how much the numbers change.

There were 500,000 US hams way back about 1989, too.

Sure - but many didn't. I think the total effect was decidely negative for the ARS.

And the control operator (the licensed ham) must maintain control of the station - i.e., such that the "guest" could not operate illegally, improperly, or whatever. It's pretty much up to the individual control operator as to what he/she must do in order to comply with this requirement.

I have handed my radio to another person, allowed them to operate the PTT and talk, etc., but stayed within reach and hearing range at all times. I could quickly grab the radio back if it were necessary. I have not allowed another person to identify with my call, I always initiate and terminate the QSO. I don't know that there would be a specific requirement for that however, as long as the control operator were truly in control. One of the many many gray areas or fine lines...

Carl.

> on the side.

Well, I have personally come across several operators in the Novice portion of 15 Meters that did not know how to send dashes. It was very difficult to decipher their code. This may come from poor hand/ear coordination or maybe they just don't listen to themselves when they send. I seem to recall that, when I got my Novice license, part of the CW testing included sending. But then, that was a long time ago. :)

After a while of listening to them ,you can pick up a rhythm and pick out their call from their CQ, but I was never able to hold a good QSO with any of them. And they all were able to tune up their transmitter.

Could be he is a criminal who hasn't been caught. Criminal
actions do not require an official criminal history. Is smoking
marijuana a criminal action if one doesn't get caught?

JJ,

Part 97.115.2b specifically states:
"The third party may participate in stating the message where:
(1) The control operator is present at the control point and is
continuously monitoring and supervising the third party's participation;

97.7 states that when transmitting, each amateur station must have a
control operator.

97.105 defines control operator duties are to ensure the immediate
proper operation of station

97.113 discusses prohibited transmissions, but do not include any
reference to station identification by a third party, or any other
specifics pertaining to third party traffic.

I think the burden of proof lies with the side claiming the restrictions
on third party operations. I can't find any.

> Kim W5TIT

Hi Kim and group,

Historically 70 cm didn't get a lot of use in our area, but that's changing. Thanks to a generous donation by Alabama Power, our local clubs are working to convert several repeaters for use on the 70cm band. We have one new one up already, in north Jefferson county. The Shelby County club is very close to having a second up and running in it's area. Another older Jefferson county 440 repeater was revamped and is running.

Several people are promoting usage, and one fellow (Mark, K4MWN) is conducting weekly nets on one of the repeaters. Usage of the band is definitely growing in this area.

To promote usage, we need to:

1. Educate new hams and existing ones the repeaters are there and open for use.

2. Monitor those freqs as much as possible, and be quick to get on there and talk when someone gets on.

3. Experiment with modes other than voice. As one fellow said, maybe shift APRS here, who knows what else could be done in this band. PSK31 anyone?

73's,

Robert / N4IXT

However, if you read the details, this only seems to apply if you have
eQSL print and mail a physical card to you by postal mail (and only
in the US, at least at this time) at a cost of $1 per card ... this
seems
to defeat the economy of eQSLing compared to "the old way." It also
would seem to put eQSL at an economic disadvantage compared
to the ARRL's proposed "LOTW" ... if I were eQSL I wouldn't be so
happy about this. (I'm not complaining about eQSL's charge for
printing and mailing a card ... that doesn't seem unreasonable for
the service ... I just view the process as an unnecessary step which
adds unnecessary cost ... to the disadvantage of the eQSL folks.)

DISCLAIMER: I am NOT affiliated with eQSL in any way and I'm
not really an awards chaser ... for me, it's just the principle of the
thing, where I see the eQSL folks as having come up with a good
idea that can save hams a great deal of cost on QSLing, and it
appears to me that the ARRL is making things tough for them in
ways that I view as arbitrary and unnecessary.

> A 2.4 GHz DSSS wireless LAN is not the same thing as 20 meters.

I don't recall implying that there was necessarily a direct
relationship, though some techniques could transcend band
choice.
```

Furthermore, the discussion in this thread for MANY days has
been focused on 2.4 GHz and the applicability (or not) of
modern technologies (such as, but not necessarily limited to)
802.11b to ham radio ...

Having said that, many of the underlying principles, like CSMA-CA
or others, that are used in "real world" communications systems
could be applied to amateur digital systems in the HF bands as well.

WADR ...any lack of understanding .. or simple lack of acceptance ...
on your part does not automatically negate the applicability of any
(set of) potential technical solutions to ham radio ...

Hello Carl,
This decision and news was just released so there are a few loose-ends yet....soon it will be world-wide. The granting of permission for eQSL - DXCC cards acceptance was for any and all cards. The nice people at eQSL will be adding world wide capability very soon...

DXCC qsl'ing is now -cheaper- and -faster- than ever....a huge and bold step in the right direction.

While noting the smiley, I feel compelled to point out that
the "preserving the non-commercial nature of ham radio"
and "making sure that things like porno sites could not be
accessed" were clearly intended as separate and equally
important examples of legitimate concerns.

Hello Group,
Just curious if anybody has checked their Repeater books as to how
many 440 machines are closed as compared to open in the Southern
California(L.A., San Diego) area. Absolutely amazing. Bill KF6WXJ
Sacramento

Depends on the "chipping rate" of the PN spreading sequence (for
DSSS), but an important factor you're ignoring is that, for equal
total
transmit power, the DSSS signal will have a proportionally lower
PSD (that's Power Spectral Density) than a narrowband signal and
thus present less interference to any given co-channel narrowband
user than a narrowband signal transmitted from the same location
with the same antenna, power, etc.

There are better ways to manage spectrum utilization than hard
and fast sub-band restrictions on modes ... that is an old paradigm
that will be obsoleted in the near future by SDRs (software-defined
radios) ... read the FCC's recent docket items on SDR ...

Try as you might, you're not going to be able to keep ham radio
stuck in the past forever, and attempting to do so is harmful to
the ARS.

[snip]

It's a well-recognized fact that the emergency management folks
would LOVE to have us be able to provide "real" data capabilities
as part of our services to them ...

> > If you don't want to "play," fine ... but why try to "prove" that

> brain and which is what this thread is is all about.

Please elaborate on EXACTLY what's wrong with things that I've
proposed for consideration. Where are the technical flaws? Why
are they so repugnant to you? After all, they're just concepts being
"floated" for discussion and consideration. Why are you so
"vehemently opposed?"

> > Having seen the information on the internet, I find it difficult
> > to believe that your mental filtering capacities are seriously

> > and probaby shouldn't continue the thread because to do so
> > would be futile.
> >
> >
> OK, so you just finally got yer free pass to HF

I didn't "get a free pass to HF" ... I took and passed the
required technical test ... had credit for the full General
and 5 wpm as an "old tech" ... I accept no assertion that
I'm not FULLY qualified to hold an Extra Class license,
no matter what prejudices you or others may hold.

>, thus I'm obliged to
> make some allowances for your lack of experience and yer Coefficent
of
> Stupidity as it relates to packet-assisted HF dxing

Having operated digital HF under a legally obtained
license while living in Mexico for several years, as well
as having worked for Rockwell-Collins in designing

military and commercial digital transmission systems
from HF through UHF, I find your assertions that I "lack ...
experience" laughable.

> and dx contesting

How is contesting relevant to this discussion?

Oh, I see ... your (ham) life revolves around contesting and
you can't see the utility of anything outside of that pathetically
limited context ...

It also appears from your comment above that your mental filtering
capacities may indeed be seriously strained, despite my intention
of giving you the benefit of the doubt to the contrary ... I guess we
DO have a different problem here ...

> I know what the fix is and "we" don't have to reinvent the wheel or
> come up with SS sub-bands to get there. The problem is not the baud

which
> jump past the mic circuitry for one and should reduce the number of
> tries before a handshake happens so given some time those radios
> oughta goose up the throughputs and fix the problem.

That's basically a "kludge" into a radio that was designed
for voice ... it's still a "narrowband FM" radio and the "data
ports" don't change that ... they simply bypass some of the
bandlimiting in the voice audio path and allow (sort of) rates
up to 9600 bps ... YMMV, depending on which radio.

Again ... bandaids on the voice radio/TNC paradigm are NOT
the answer for the future datacomm needs of the ARS ... what's
needed are radio modems, purpose-designed for transmitting
and receiving data (well).

All I'm pointing out here is if it's free, where's the commercialism?

Roger. Kinda amazin', ain't it. Seriously, I object to the odd word or phrase here and there. But there really isn't such a great philosophical disparity between my views an practically anyone else's here. I always try to find the middle ground. I tend to speak up more when I think somebody is out in left field somewhere - especially when they take an otherwise reasonable position.

Cecil likes to make bombastic sounding statements. His logic is usually impecable, but if I can see a crack in it I like to let him know that I saw it. But I think what it really boils down to is that I like to see amateur radio promoted. I kinda think that it's our job to do that, and when I see some of us denigrating the Service I guess it touches a nerve. Maybe that's why I don't come back to Larry and Dicks bombastic remarks - at least they're coming from a place that is basically pro-amateur radio. Other than that, being pig-headed is a trait that ALL of us here share in common. ;-)

I saw your post to Dennis, et al. which had an entirely constructive tone and just thought I would comment.

This insinuation of a high level of "professional technical training",
from
Mr. "The basic, underlying principles of communications theory
are irrelevant to amateur radio." Carroll is REALLY the stuff that
ROTFLMAO is made of ...

>What about the unknowledgable newcomers you so carelessly mislead?

What about those you've mislead (or tried to) into believing that
the most basic principles of communications theory are "irrelevant?"

At least Cecil WAS a technical professional (before he retired),
as I recall, from what you've described Dick, you were, at most,
a technician.

Please try to understand that my intent is not to denigrate
ham radio, but rather to prod it (kicking and screaming,
if necessary) into the present, and ultimately the future,
rather than remaining silent and seeing it fester interminably
somewhere in the distant past.

(I know, you won't like this comment either, but that's
the truth as I see it ...)

I'm pro amateur radio ... otherwise I wouldn't spend any
time on it, let alone the time here or the many hours I

devote to NCI activities.

It sounds to me like you are referring *sigh* again, to the Carl Stevenson issue? Is that right? Look, Jim, I am sorry you have such an issue with Carl Stevenson. The little I've noted and observed during the debate about this whole thing is that, if anything, Carl is nothing but every bit as opinionated as those with whom take issue on some of the ideas he has.

You don't know me well enough, but if you think I'm going to spend any more time on the topic than that, then you're just plain wrong. I don't know

why anyone would?! It is "a thing" in a newsgroup, will never ever have any impact on my life, and doesn't affect me one way or the other. Carl Stevenson, or anyone else for that matter, could be the most horrible tyrant to walk this planet--but if I'm never going to meet him, never going to be impacted by anything he does or says, then *why* would I concern myself with the matter?

> >
> >Dick's bought into the concept that the end of the ARS was
> >eminent, due to Restructuring (as it's called).
>
> So? Maybe he's right. I don't think he's right, but it's way too soon to tell.
>

I doubt he's right, and I have no problem at all stating that I doubt he's right. Especially since, Little Dick and I are diametrically opposed to each other so it is highly unlikely that we would ever see a matter from the same perspective. Ham radio could fill to the brim tomorrow with people who act in manners that Little Dick finds abhorrent and I have absolutely no problem with. To Little Dick, ham radio would then be "dead." To me, it would not.

As I said, Jim, you don't know me well enough to even come close to trying to figure me out. Secondly, you've always impressed me as a much more logical person than to think that you can surmise a person's id without ever having met them, known them, etc. I stand corrected on my impression of you. Thirdly, I think I've commented enough on the Carl Stevenson issue. I have read some of the debate, have seen some of his responses, seen some of others' responses, and I have decided that your idea of Carl Stevenson is different than mine. I've never been one to let others choose the way I think of other people. Sorry that disturbs you to the degree you display. It will leave me forever puzzled but, believe me, I'll hardly dwell on it...just as I will no longer dwell on the Carl Stevenson matter.

JJ,

The restrictions against initiating a call or identifying the station
do not appear in Part 97.

Thus, it would seem that a "guest" operating under the continuous
supervision of a properly licensed control operator can do whatever
the control operator is allowed to do, as long as the control operator
permits it and it is otherwise within the rules.

>I was asking what you think the FCC's intent was.

I think it was to point out that one of the B&Ps of the ARS is technical
advancement. Which comes in all flavors.

> I'll rephrase the
>question. Do you think the FCC feels that amateurs should be making
>contributions to the state of the art that have applicability to radio
>services other than the ARS?

Sure - they'd like it if hams would invent something new.

But, realistically, how many cutting-edge advances are amateurs who are not
RF engineering professionals going to make in their basement workshops? A
few, sure. But most of the advances are going to be in the form of education,
adaptation, practicality, and simplification.

--

Just a few minutes ago I was reading about the W1JEO SSB exciter. (QST, November, 1950). Used surplus FT-241-A crystals and about 4 tubes to put a few watts of SSB on 75 meters. Was this an "advance in the state of the art"? Not in terms of doing something radically new, because SSB had been around for more than 20 years by then. The advance was in the simplicity, economy and adapting of old parts to new uses.

--

I think part of what the FCC is trying to say is that if hams limit themselves to
using only manufactured ham gear, they are not doing the ARS any good. The FCC can't come right out and say we shouldn't be "appliance operators" because it would tick off "Yaecomwood" enormously. But the point is the same: new modes and methods do NOT come about by using only off-the-shelf made-for-ham-radio hardware and software.

Well a HT on the belt sure won't do it. You might want to get the no code
techs on board.

What ever happened to slow scan TV? I know, relatively poor image
quality. But the commercials have already trumped us with the satellite
video phones anyway, as shown by news clips from Afghanistan.

> Imagine how way cool it would be if hams could
> get those images to other parts of the country quickly.

That should be a snap. Adapt technologies already in use. Sending a
compressed .jpg file from your digital camera using a digital HF mode
should be easy enough.
Getting something like that coordinated, up and running is the sort of
thing the ARRL should be good at. Why aren't they?

End copied newsgroup exchange

HooBoy talk about Turnabouts of Record Proportions! Or is this the
Mother of All Retreats? So when was it anyway, two, three years ago
you were babling on at great lengths here that given your druthers
you'd "layer" SS from the bottom to the top ends of the 20m band and
tough shit about what SS would do to the Luddite narrowband users? Yes
you did din ya? Hmmmm?
>
>
So now you've FINALLY "retreated" into advocating deploying ham SS in
"a band where there is negligible use of narrowband modes" vs. yer
former bluster & technoid bully bullshit. I don't buy into The New
Carl at all of course because you're still thumping for the
abolishment of bandplans and mode-specific sub-bands but never mind
that detail. Reteats come one step backward at a time.
>
>
I'm gonna take a giant leap here and take it upon myself to speak for

Carroll, Kelley, Hare, Miccolis, myself and the others in this matter.
Those of us who have been up your butt for eons about implementing SS
the ways you have been postulating for those same eons. Until just
now.
>
>
I submit that there isn't a damned one of us who would have Objection
One IF you fired up SS in some remote and unused ham spectrum space
where SS woouldn't have any particular impact on narrow-mode
operations. There's plenty of that commodity out there isn't there?
And I'll take it a step farther: We'd all SUPPORT that effort too.

Nah, it's apples to apples. The valid analogy being a peek at what we
could expect when "wide modes" are co-mingled with narrow modes on HF.
"Power levels" be damned. Sure, the lights prolly dimmed in the
neighborhood when the Soviets powered up that monsrosity. But then the
thing was thousands of miles from here. But YOU might be on the next
block over with five milliwatts of SS and there goes the whole
freaking band here. Something or another about some Law of Squares or
something . . . what the hell do I know, I still run CW . .

From the arrl.net webpage in Enforcement actions section:

January 29, 2002

Mr. Glenn A. Baxter
RR1 Box 779
Belgrade Lakes, ME 04918

Re: Amateur Radio license K1MAN

Dear Mr. Baxter:

On May 14, 1999, after numerous complaints about your Amateur station regarding broadcasting, deliberate interference, failure to identify, poor signal quality and erratic starting and stopping times, personnel from the Boston office of the Commission monitored your station and attempted to inspect it. There was no one present at your station while it was transmitting on Amateur Service frequencies. The transmissions continued while Commission personnel went to your residence at 1 Long Point Road, but there was no one present there either. Again on May 15 while your station was transmitting, Commission personnel attempted an inspection but there was no one present.

Since the Amateur Radio Service rules require that Amateur stations be under the control of a control operator, and that the control operator must ensure the immediate proper operation of the station, we requested by letter dated June 25, 1999, that you provide information to the Commission, pursuant to Section 308(b) of the Communications Act of 1934, as amended, regarding the operation of your Amateur station. You responded by letter dated July 25, 1999, but your response failed to provide the information we requested. We notified you of that fact by letter dated August 4, 1999, and detailed the inadequacies of your response.

Specifically, you did not provide the name, address or phone number of the control operator for any of the "broadcasts" or "bulletins" such as prerecorded interviews, transmissions of answering machine responses, live interviews, or live, pre-recorded or automated station

identifications
transmitted by your station. Among other deficiencies of the response, you did not provide dates
and times Amateur station K1MAN transmitted without a control operator.

You also stated in your July 25, 1999 reply that you had not received our June 25 letter by certified mail and that our letter had "misrepresented itself as Certified Mail". We reminded you
that you had signed the certified receipt for that letter, and we provided you with a copy of that
certified receipt.

You responded to our August 4 letter by letter dated August 24, 1999. During our review of the
information you provided, your Amateur station ceased operation. As a result, we held our inquiry
in abeyance. The U.S. District Court in Maine subsequently dismissed your lawsuit against the
Commission, and dismissed your petition for reconsideration of that dismissal as well.

You recently resumed operation of Amateur station K1MAN. In view of that resumption and the resulting complaints we are receiving about deliberate interference, threats against those who do
not relinquish frequencies for your use or who would complain, or who have complained, erratic
operation, broadcasting, unauthorized tape recording and broadcast of telephone conversations,
business use of an Amateur station and lack of station control, we have resumed our inquiry into
the operation of K1MAN.

In reviewing your letter dated August 24, 1999, referenced above, and your actions subsequent to
coming back on Amateur frequencies, it appears that your understanding of certain Amateur Radio
Service rules may be incorrect. We will outline the apparent misunderstandings below.

Amateur Station Control

With regard to control of an Amateur station, your letter of August 24 indicated that the control
device for your station was a "Radio Shack timer", and that the control points for the station
were "the main power switch at the transmitter site" and at the location of the control operator,
wherever that may be". You further stated that on the dates in question, May 14 and 15, 1999, you
were the control operator and were in "both Belgrade Lakes and Augusta in either mobile or portable modes".

Section 97.7 of the Commission's rules states that "when transmitting, each Amateur station must
have a control operator". Section 97.105 states that "the control operator must ensure the

immediate proper operation of the station, regardless of the type of control (emphasis added).
Section 97.109 states that "each Amateur station must have at least one control point", and that
the control operator must be at the control point when the station is locally controlled or remotely controlled.

Section 97.7 further states that a control operator need not be at the control point if a station
is automatically controlled. However, as Section 97.109 also explains, only stations specifically
designated in Part 97, such as a space, repeater, beacon or auxiliary station, may be controlled
automatically. There is no provision in Part 97 that allows an Amateur station transmitting information bulletins to be automatically controlled.

In summary, your control of the station by a "Radio Shack timer" while you are absent from your
Amateur station is a violation of the Commission's Rules. You were not in control of your station
on May 14 and 15, 1999 while you were in "both Belgrade Lakes and Augusta in either mobile or
portable modes". Your statement in your response that "K1MAN has never transmitted during the
current license term without a control operator acting in full compliance with rules 97.105 and
97.109 as well as all other applicable FCC rules" is untrue.

Simply put, to comply with Commission rules, you must be at the transmitter, or at the transmitter
control point, every moment your station is transmitting, when your station is locally or remotely
controlled. If the station is controlled by telecommand from the control point using a radio link,
the frequencies used for telecommand must comply with the Section 97.201 requirements for an
auxiliary station (may transmit only on the 1.25 m and shorter wavelength bands, except 219-220,
222-222.150, 431-433 and 435-438 MHz segments).

Publishing a Transmitting Schedule & Interference

It appears that you may be under the misconception that by publishing a transmitting schedule of
K1MAN, you have certain rights under Commission rules regarding the control operator and frequency
sharing requirements that you would not otherwise have.

With regard to the requirement for a control operator, publishing a schedule does not relieve you
of that requirement in any way whatsoever. Section 97.113(d) of the Amateur Radio rules states

that by publishing a schedule of transmissions at least 30 days in advance, a control operator of
a club station may accept compensation for the periods of time when the station is transmitting...information bulletins, providing certain additional conditions are met. Publishing
a schedule of proposed transmissions, therefore, relates only to a club station control operator
accepting compensation. We note that this is irrelevant to the operation of K1MAN because K1MAN is
not a club station.

Simply put, to the extent that you start your transmissions on top of ongoing communications of
other amateur service stations, you will be engaging in deliberate interference, in violation of
Section 97.101 of the Commission's rules. No amateur service frequency is assigned for the exclusive use of any station. Your publishing an intended transmission schedule does not exempt
you from that rule.

Threats to Complainants and Other Users

Your sending "Felony Complaint Affidavits" to other Amateur Service licensees who complain or
intend to complain of your operation, or who do not relinquish frequencies to you, was the subject
of a Warning letter to you dated December 11, 2001. You have also been warned about such "Felony
Complaint Affidavits" by the United States Attorney in Maine.

The Commission will view any threats made by telephone, through the U.S. Mail or on radio frequencies to Amateur Radio licensees who file complaints with the Commission, or who do not
relinquish frequencies for your use, as very serious.

Broadcasting

We also note that on your web site and in your radio transmissions, you refer to your transmissions variously as "broadcasts, programs, talk shows, bulletins, pre-recorded interviews"
and so forth. We have received complaints that you have broadcast comedy shows and commercial
messages. We caution you that Section 97.113(b) of the Amateur service rules prohibits amateur
station from engaging in any form of broadcasting. Certain one-way transmissions, such as information bulletins, are allowed as specified in the rules.

Tape Recording and Broadcasting Telephone Conversations

We have received and have under review complaints that you have tape-recorded telephone conversations without the consent of the recorded party and that you have broadcast such tape
recordings. We caution you that such recording without consent may be in violation of state

or
federal law. We will contact you under separate cover regarding those complaints.

In summary, it is very important for you to understand that we will review all valid complaints
concerning the operation of your Amateur station, and that Commission personnel will again inspect
your station. The rules of the Amateur Service are straightforward and easy to understand. To the
extent that you do not comply with Commission rules regarding the Amateur Radio Service, then to
that extent enforcement action will be taken against your licenses. That enforcement action may
include revocation of your station license, suspension of your operator license, a modification
proceeding to restrict your operating privileges, or monetary forfeiture.

It is also important for you to understand that if these matters are not resolved, your
operator/primary station licenses will not be routinely renewed; but instead will be designated
for hearing before an Administrative Law Judge. In such a proceeding, you would have the burden of
proof to show that your licenses should be renewed.

The Cherokee CM-10 Plus --> IS NOT <-- an FCC type accepted
radio and it is therefore illegal to market for retail or private sale in the
United States, as well as operate within the same. That says it all.

scarey stuff... interefering via his broadcasts is one thing but taping
phone conversations and then rebroadcasting? what the hell was he thinking?
if anyone tape recorded what he transmitted he could be seriously screwed.

You're right. FCC doesn't spell out what the control operator has to do in detail, he may well be allowing a non-ham to operate who is as familiar with radio as he is, but doesn't have a license. But it's the control operator who is responsible. If the ship hits the sand he is where the buck stops. If he's comfortable with going to sleep while his third party operates under his license that's his business, but he catches any and all flak.

Brian, that pretty well nails it. While most of us ham away on the bands with all the latest
stuff running the latest as well as the earliest digital modes, Carl yaks away on SSB but hehas BIG
plans for us all. *His* plans for ham radio, all of it, in total. Trust that asshole? Not much.
Change his stripes? Like a leopard.

Yeah we know what your plan is, you laid it out right hear a long time ago. Youre still as much an ignoramous at ever, and your understanding of the amateur radio service is as lame as ever and will clearly never improve. Dumshit is a term that leaps to mind.

> you were babling on at great lengths here that given your druthers
> you'd "layer" SS from the bottom to the top ends of the 20m band

That's not what I said ... Gary Coffman and I both proposed
"strawman designs" for systems that in the space of the 20m
```

"CW band" (14.000-14.150) could support literally 10's of
thousands of simultaneous "20 wpm CW equivalent" QSOs
with virtually no interference or appearance of congestion.

As far as I recall the details, Gary's system wasn't SS and
I know mine wasn't ...

> and
> tough shit about what SS would do to the Luddite narrowband users?
Yes
> you did din ya?

NO, I didn't say anything of that sort either ...

I have stated the view that, under certain conditions, in some
bands, SS could be "overlaid" on existing uses without causing
harmful interference. I continue to hold that view.

Let's get one thing clear ... your failure to understand what
I say doesn't change its meaning (or make it wrong for that
matter ...)

> So now you've FINALLY "retreated" into advocating deploying ham SS
in
> "a band where there is negligible use of narrowband modes"

I haven't "retreated" into anything ... I merely stated the context
of the current conversation accurately in response to *your*
INaccurate characterization of it ...

> vs. yer former bluster & technoid bully bullshit.

Which is a figment of your imagination (too bad you don't
seem to have one when it comes to the possibilities of
technical advances in ham radio ....)

> I don't buy into The New Carl at all of course

There is no "new Carl" ... my views on technical issues
haven't changed substantively at all.

> because you're still thumping for the
> abolishment of bandplans and mode-specific sub-bands

I stated, and stand by, the idea that "cast in concrete"
spectral usage results in poor spectral utilization and
that more intelligent means of allocating the use of
spectrum improves spectral utilization. That's a technical
issue ... don't try to make it a political/religious one ...

> Reteats come one step backward at a time.

The only thing backward in this exchange is your
perspective ...

> I'm gonna take a giant leap here and take it upon myself to speak
for

<snip>

About freakin time, too, arrogant scofflaw b*st*rd that he is. Somehow I don't think he'll be following the rules anytime soon, though.

I was gonna post that letter myself this morning, but didn't want to start another 195 post thread, LOL.

I notice he hasn't been on the air lately.

I taped his "show" a few times two weeks ago, figured I could at least contribute enough to get him on the failure to ID thing. But I see there's no need to send them in.

I happened to hear one of the other incidents on today's enforcement page too. Guy accidentally left his mike keyed and had a colossal screaming fight with his girlfriend--live on the air for over an hour. Embarrassing as THAT was, turns out the guy was a Technician class and not authorized to use the frequency at all, LOL. Sometimes you just have a bad day...

Guess I missed the vote to establish "the majority opinion".
When and how was it taken?

> FCC has been pushing for the end of code testing since 1975.

Pretty slow progress for the entity that has always had the final
say in such matters.

>Respectfully, JJ

I have had this issue cleared up by direct inquiry to the FCC many years ago. The third-party operator can initiate QSO's, do all the hands-on station operation, and send the call sign of the control operator or club station, as long as a properly licensed control operator is present, and the operation does not exceed the control operator's privileges, or otherwise violate FCC rules. There is no requirement for the control operator to initiate the contact and "hand off" to the third-party operator.

>many many gray areas or fine lines...
>
>Carl.

Carl:

"Hand-off" operation such as you describe is not necessary, as long
as you, as the licensed control operator, are physically present when
the operation takes place and are able to suspend or terminate the
operation if the third-party operator attempts to exceed your privileges
or cause a violation of FCC rules. All this means is that you must
keep an eye on the frequency display and power levels, and make
sure the 3rd party operator doesn't start causing deliberate QRM or
using foul language, etc. The only time you need to physically take
control is to "pull the plug," if need be. If you step out of the room,
the Field Day tent, or get beyond arm's reach of the HT user, or
in any way become physically incapable of intervening in the third
party operation, then the third party operation must be suspended
until you regain your span of control. Any violative activity identified
with your call sign is *your* responsibility...therefore you should
not permit anyone who may tend to be a "loose cannon" on-the-air
to operate unless and until he/she understands that he/she may
be pushing the buttons, but *you're* pulling the strings!

>
>Carl - wa6vse

Carl:

Don't look now, but I can print my eQSL's from the web site. Why
wouldn't the ARRL accept these printed cards from on my own
laser printer as opposed to those mailed by eQSL? It would be
a lot easier for me to make the contacts on-the-air and send/receive
hard copy QSL cards via direct mail and the QSL bureaus, than
it would be for me to fake the computer-generated eQSL's. And
the validity of my eQSL's can be verified by the ARRL by making
an inquiry directly to them, if they have any doubt. I can see no
reason for having cards mailed BY eQSL, in order to claim awards
credit.

Cecil:

I am personally incapable of convincing any amateur radio newcomer
to choose to learn Morse code. That is something they need to
decide for themselves, for they alone must expend the effort required
to succeed. I can't do it for them, I am not the "Elmer" type. I
received very little "Elmering" when I was getting involved in ham
radio, so I have no role model to emulate. I became a ham on the
basis of my own internal curiosity, enthusiasm, and willingness to
research the answers to my own questions. I had the initiative and
ingenuity to learn what I needed to know to pass my tests, usually
with perfect scores, and get on-the-air in spite of challenging
operating conditons. Most of the ham "newcomers" I meet want to
avoid the learning process and go directly to the point where they
can make their PTT buttons work. I took a much longer and more
challenging road to my success as a ham, and I cannot impart my
experience upon anyone else, other than to advise them as to what
they need to do. But I cannot do it for them, which is what the
majority of ham newcomers seem to want these days.

Guess what? It wouldn't be *my* first choice, either. I'd prefer an
error-correcting digital mode, capable of passing large volumes of
message traffic with maximum speed and complete accuracy, as
long as I had the equipment, power, and operating location capable
of supporting the use of such a mode. Under more austere
conditions, however, Morse/CW would be a very practical choice
if my goal were to conserve electrical power, or I was faced with
poor band conditions. I'm just glad I have the option to use either,
or both -- as conditions should warrant.

Kim:

While you and your fellow codeless minions are stuffing yourselves with
pizza and beer at the post-cleanup party, the REAL emergency communicators
will still be sending/receiving piles of Health and Welfare traffic using CW
and the digital modes. Of course, you will not be involved in this, the real
"emergency" communications effort, since you choose not to gain the skills
necessary to do so. If, God forbid, a widespread emergency should ever
visit the area you live in, it would interesting to see exactly how you would
personally contribute to the disaster relief effort as a radio amateur. Just
what is your own personal view of your potential contribution?

>Yep, you got it. I asked that of Jay here a bit ago. It seems the hate and
>contempt from people like Larry, Dick, etc., leave one to truly wonder what
>values they place upon their effort (or not) to help someone.

Kim:

As an amateur radio operator, I have a significant ability to assist others
who may be able to gain aid or comfort as a result of my communications
capabilities. The way I "value" my abilities is very realistically -- I could
do a lot better under some circumstances, but I could do no worse than
the majority of hams under most circumstances. I really don't expend as
much effort placing a "value" on myself as an emergency communicator
as you obviously do -- simply because I prefer to quietly continue to gain
and refine my operating skills, while others (like you) prefer to brag about
what you can do -- without ever really being put to a test.

>You're right, Cecil. I get the distinct impression, also, that some would
>just as soon let others die as acknowledge a signal beneath their
>expectations.

Hmmm -- I see. So now, I'm being accused of letting some LID die because
I can't decipher what he's trying to send -- therefore, it's MY fault if he
does
die! Right. So now, in the eyes of Kim Walker, W5TIT, Judge and Jury, I
am a murderer! And all because I advocate the continuance of a requirement
for hams to know and be tested on a valuable communications skill. Kim,
you've really got some weird mojo working on you!

>But, it's kind of like when I hear crappy people talking
>about how *they* went to war for my freedom.

I think your last statement has just given us a perfect example of a "crappy" person.

>I like to remind them that
>they went to war to win freedom for people who think like them, so they
>could come back home and tell everyone how they should think. With soldiers
>like that fighting "for me" who needs the enemy?

Don't look now, Kim, but American soldiers don't fight for the right to tyrannize the population. They fight for the right for all Americans to retain their freedom and democratic society, and to liberate others from oppressive regimes. Among other things American Soldiers, Sailors, Airmen, and Marines have fought and died for over the years, is your right to make a perfect idiot of yourself every time you click on "Send."

You owe an apology to each and every veteran in this newsgroup.

>be more operators available for emergency HF communications. Some of
>them will choose to have CW in their bag of tricks. One doesn't have
>to have a license to learn Morse code.

Cecil:

When we do get to a No-Code General (and Extra) license, we *will*
see an end to the growth in the numbers of hams who have CW in
their "bag of tricks." I am already seeing that now. The "newcomers"
I've seen in the post-Restructuring era are not making any effort
whatsoever to learn the code, beyond passing the 5 WPM test to
attain HF voice privileges. They are definitely not getting on-the-air
with CW. There are occasional exceptions, like my friend Bert, but
he is a lonely standout in a very large crowd of new hams who will
never know the value, and the fun, of Morse code proficiency.

The code testing requirements have been largely voted out of
existence by lazy, indifferent people who seek only the immediate
power of HF voice privileges, without the effort required to learn
a valuable communications skill. This will ruin the ARS as we know
it, by eliminating it's role as a means of training well-balanced,
knowledgeable communicators, and replacing them with technically
uninvolved, marginally capable appliance operators who will not
have enduring value in challenging communications conditions.
Moreover, they will not value their easily-acquired privileges, and
their interest will wane quickly, once they are faced with the chaos
that will be created on the HF bands by their fellow indolents.

>opinion as if it were not there. Would having a larger majority have changed
>their mind? Nope.

Jim:

I respectfully disagree with your disagreement, and your self-answered question. I believe that if FISTS had organized the same type of campaign against a significant reduction of code testing requirements, that the FCC would have had no choice but to pay attention to their position on the matter. If double the number of comments had been received by the FCC, the clear majority in favor of either the status quo in code testing, or a workable compromise (like 12-13 WPM), then the FCC would have been very hard pressed to act against such overwhelming advocacy.

>FISTS wisely stayed out of the fracas, knowing that taking a political
>position would only divide their membership.

Why should that be? FISTS is called "The International Morse Preservation Society." What do those words mean? That we'll keep Morse code alive as long as there are a bunch of withered old codgers around, exchanging numbers on the air in run-together CW using mal-adjusted bugs, or that we'll support the retention of Morse code proficiency in the ARS through continuation of code testing as a requirement for maximum HF operating privileges? Remember, many workable compromises were totally ignored -- including the removal of the code testing burden from the FCC by having the ARRL do all the test scoring, record keeping, and updating of the amateur licensee database.

>Note that FISTS and the ARRL
>did encourage all to express their opinions direct to the FCC.

Well, that was mighty nice of them to encourage us to do something we all had the right to do anyway.

>FCC has been pushing for the end of code testing since 1975.

And it seems as though they'll soon get their wish. However, as a person interested in the "preservation" of the Morse code, and a FISTS member, I would have preferred it if more of an effort had been made to get the FISTS organization to live up to it's title.

I think also, that the FCC has also had hopes that amateur radio
can be a stepping stone for youth towards becoming engineering
proffesionals, etc.

> But, realistically, how many cutting-edge advances are amateurs who are
not
> RF engineering professionals going to make in their basement workshops? A
> few, sure. But most of the advances are going to be in the form of
education,
> adaptation, practicality, and simplification.

That, unfortunately, is more a function of the significant advances
in technology itself, microchips, etc. Thosse advances make "basement"
development somewhat difficult in many areas.

Remember too, that was during a time when the typical receiver of
any consequence was probably the dollar equivalent of well over $500
in today;s dollars. Many "do-it-yourself" articles then were targeted
at inexpensive way to get on the air...in terms of typical incomes
of the 50's.

> I think part of what the FCC is trying to say is that if hams limit
themselves

made-for-ham-radio
> hardware and software.

I disagree. The issue is more the need to focus on where the more likly
areas are that "home experimentation" can truly lead to something new.
Repackaging old parts when there's a host of inexpensive, quality
commercial gear available isn't likly to result in any real new
advances (IMHO). More likly advances can be done in software
for equipment too.

>QSO. I don't know that there would be a specific requirement for that
>however, as long as the control operator were truly in control. One of the
>many many gray areas or fine lines...

And I have allowed unlicensed third parties to operate my station and initiate calls and identify my station.

I once saw an FCC official speak at a hamfest. He talked about rules. He held up a copy of the ARRL's FCC Rule Book and opened it to the Part 97 text in the back. He then asked hams to do the FCC a favor if they had a question about the rules and first open the book to the rule the ham would like the FCC to read to them.

It seems to me that the rules permit unlicensed people to participate in the operation of an amateur station. The rules specifically outline some restrictions on that, such as the prohibition about having that third party communicate with hams in those nations with whom the US does not have a 3rd party agreement. If the FCC wanted to prohibit the third party from identifying the station or initiating calls, the rules could easily have done so.

It seems to me that the rules require that the control operator retain control over the station and what communications issue from that station. In general, it is up to the control operator how he or she will do that. If I am letting a trusted friend with some radio knowledge and experience be a third party participant in my station, I will use a different degree of control than I will if I allow a total stranger to use my station at a field event.

These systems are not being designed or operated under Part 97. Some of those developing them are hams, from what I read, most are not. Some of those using them are hams, most are not. They operate without a control operator and can be accessed by non hams at will.

>But for those who aren't amateur licensees, they do have to be limited in
>power output.

>Time to get a 2.4 amp (and a wireless lan)!

The Part 15 devices on 2.4 GHz are limited to 1 watt and a 6 dBi gain antenna, with a provision that a higher gain antenna can be used if the power is reduced by 1 dB for every 3 dB increase in antenna gain *for point-to-point* operation (not point-to-multipoint).

One could use a 36 dBi gain dish with a 20 dBm output transmitter, under Part 15.

Under Part 97, one can use up to 100 watts, with unlimited antenna gain, with the further provision that automatic power control must be used if the power exceeds 1 watt. In practice, with adapted Part 15 devices, 1 watt will be the practical limit, because to my knowledge, the present spate of Part 15 devices do not operate under automatic power control. I believe their internal programmability does give access to power output, but that function does not exist in the applications software or perhaps even the driver. I have my calls in to low friends in high places in the industry to find out how much of that info about programmability can be put into the public domain.

If my XYL is out-and-about, I will allow the 10 year old to answer her
call. However I take the mike at some point and state "This is K4YZ, control
op present".

When she does get a call of her own, she won't balk on the mike.

>but they are what we've been mostly talking about
>here in the form of 802.11b as an example useful for high-speed
>networking) trade bandwidth for communications efficiency and
>required SNR ... they have "processing gain".

Yes, but do be clear that under theoretical conditions, process gain gets one up to 1.8 dB of "efficiency" in terms of improvement to SNR. In practice, because of phase jitter and the like, it would be less, and might even be less.

Unfortunately, there seems to be a lot of misunderstanding about "process gain." If one has 60 dB of process gain, one does not get to run 60 dB less power to communicate the same data at the same speed as one could do it using a narrowband mode.

And lets face it, the process gain of Part 15 SS systems is just enough to meet the rules that let the manufacturers use high power.

And, don't forget that one of the rulemaking changes on the plate is to eliminate process gain altogether, the idea being that if a high-speed PN code is going to have a certain effect on other users, the effect would be the same as if the data being sent was sent at the same rate, without spread spectrum.

In both cases, what counts to the narrowband users is PSD - power spectral density -- the amount of power in each unit of bandwidth. It is almost always specified in Hz.

As a first approximation, a 1 watt SS signal spreading over 20 MHz is going to have an average PSD of -43 dBm/Hz, or 0.05 microwatts in every Hz of that bandwidth.

>you exaggerate the potential for widespread interference.

Perhaps, but I have seen that potential trivailized, too. Do the math for that 1 watt SS station with 6 dBi of gain at a prime microwave propagation location and tell me what the received power level will be 1 km away. A good way to look at it is that the 20 MHz spread signal has 40 dB less interference potential to an SSB bandwidth, 30 dB less to an FM bandwidth and 46 dB less to a CW bandwidth than would a 1-watt station operating with all of its power contained within the above mentioned bandwidths. Helpful, but considering that a nearby SS station could be tens of dB over S9, to use signal levels that most hams will be familiar with, 30 to 46 db is not going to eliminate interference.

Little Dick: I owe no apology to anyone in this newsgroup, nor to any veterans. Their are fine, fine ex-soldiers who have the same exact opinion as I, so it is not unique at all.

My response that was written was to the observation by Cecil that he has seen Larry say things such as noted (that CW from less-than-maxed-speed-operators would be ignored/fall on deaf ears/whatever you want to call it. I believe I have heard Larry mention sentiments like that a few times. Whether he is *serious* or not, you'd have to ask him. I believe that his voraciousness and stated subjugations against other people makes it highly likely he *is* serious. In any case, I would hope never to be under the cause and effects of Larry Roll were a disaster situation to arise around me.

And, I believe that anyone who expresses such hate and determination against other people, whether it for their color, religion, sex preference, or CW preference, went to war for the wrong reasons. They *didn't* go to war to gain a license to come home and denigrate all over people for the way they think, Dick. It's as I've always said: you can dislike me as a person, but to express disdain over the way I think as a person is another matter entirely. We can disagree about CW, I am fine with your love of it. I am fine with your hate of my dislike for it. But, when you start calling me dumb or stupid or fat or ugly or whatever, using the basis that I don't like CW or think the way you do...well, that goes way beyond your welcome. I consider people like that an *enemy* to our country and way of life. Not someone to thank.

Hey, Mr. I'm-Smarter-Than-Everyone-Else: First I have no "fellow" codeless minions since I am a coded ham radio operator. And, with all the emergency communication I have been a part of, from learning to training, I have never seen a focus on CW operations. I just haven't. In the event a widespread emergency happens in this area, we'll be fine and you be sure to stay away, PUHLEEZE! What do you mean what is my "own personal view" of my potential contribution? Is that you wanting me to gloat? I don't act like you, Larry.

Lie detector exams are notoriously flawed. A polished liar can
defeat them. A nervous truth-teller can confuse them. That's why
they are not admissible in court. The fact is that you cannot
prove that you have never smoked marijuana.

The newcomers are naturally attracted to SSB. After the new wears
off, some will choose to try CW/digital modes. What you don't
seem to realize is that many OT's don't have CW in their bag
of tricks. Many, many hams took the Morse code exam and promptly
forgot everything they knew about CW.

>

So, now someone who has a signal beneath your expectations is LID, eh? I am not surprised at all to see that from you, Larry Roll. Typical of what I believe your character and nature are. By the way, just so you'll know: there are no "LIDS" in a disaster--there's likely to be anyone (licensed or not) on any radio asking for help.

>

I didn't necessarily say that, Larry. I *did* say that I get the *distinct impression* that you--and others like you--*would* let someone die if they had a signal beneath your expectations. I was clear, concise and deliberate in my characterization. Then, in your first response related to that, you call the person who may be incapable of your superior operating, a LID. Hey, if the shoe fits wear it. If not, then simply state otherwise. You didn't state otherwise, I see.

> >
> >But, it's kind of like when I hear crappy people talking

Hmmm, I'd be trying to help, whether someone had a signal or not. In fact, it's my guess that in the immediate aftermath, radio is the last thing I'd be thinking about, Larry. I'd be out moving rocks if I had to.

> >
> >I like to remind them that

>

Of course they didn't. Not all. However, when I hear someone using extreme prejudice against another because of the things they believe or the way they think, then what other conclusion is there but the idea that leaves one wondering if that person was *really* defending everyone.

>
> They fight for the right for all Americans to

>

Larry, you describe the true soldier above. You describe the person who truly believes in all freedom and who would be the least likely to express prejudice against another. Some soldiers are *not* as you describe above. I know black ex-soldiers who would just as soon every whitey on Earth would be smitten; likewise I know white ex-soldiers who feel the same about blacks--and many other races. Both will swear to you that "the time is coming" when a huge Civil War will be the time they pick up arms and "finish what they were fighting for." Their words not mine. And, while it's a broad broom to push, I believe there's people on this newsgroup who are so filled with disdain and contempt against others that there'd not be a single flinch of emotion over the death of some they've expressed such disdain toward.

>
> You owe an apology to each and every veteran in this newsgroup.
>
> 73 de Larry, K3LT
>

No, I don't. Like I said, if the shoe fits, wear it. If it doesn't fit, then what I said should be of little concern. There's no denying there are people such as I describe. I *don't* condone their thoughts and behavior. I do believe there are soldiers who have served without honor. I've known some of them.

Must you ask? All the raving about "software defined radios" and you completely overlook all the "software defined modes"!

I, for one of many, no longer need that mechanical monstrosity that was a Model 19 that took up half my shack and smelled like a rusting Diesel to work RTTY and a dozen other modes. Just click the mouse on my choice and go to it......

I think it does, to the extent it can. Does the Part 15 Radio Service
advance the state of the art, or do companys do it? Hams are at least as
involved in radio development as any other demographic. Don't you think?

I've said it many times, but here it is again- I turned the other cheek early in the game, and it got smacked just as the first. Slam me once, shame on you, twice, shame on me. There will be no third time for free. Stenson obviously cancelled one of his posts before I could respond, and that was perhaps wise of him, but I could give a response anyway. He's not worth time. He doesn't even know that it's HE that is the technician and I am a longtime Extra.

Maybe you're referring to K1MAN. Yes, the FCC expliciting wrote that the
control operator must be monitoring and in immediate control. He can't do
that while he's asleep. But they don't say he has to be the one who talks
on the microphone.

I think JJ was asking for specific FCC rules. He already seemed to have
plenty of anecdotal input.

There *is* occasional short term spread spectrum activity on the amateur 20 meter band, stuff you won't see unless you spend a lot of time watching a spectral display. It shows as short bursts of radio energy that is definite intended radio signals and not random noise, although there's plenty of that, too. Of course I don't know the source. But I can recognize intended radiators as opposed to randon noise generators. I have no idea of tghe source nor the characteristics. I imagine its some governmental or military signals.

That was the attitude I brought first to rrap and for my trouble I was immediately set upon by the codehating jackals as the primary reason for their personal failures. and that attitude persists in people like Stevenson to this day. It appears only the undertaker can help him solve it.

That same some wanted to change the SS rules for VHF and up, too. The FCC limited SS to UHF and chose to have a rule that unconditionally makes the operator of an SS station responsible for harmful interference to narrowband users.

If I got everything I want in life, I probably wouldn't enjoy life all that much. :-)

Probably by all the little pops and burps that amateur SS would make if heard on HF. One would probably have to do a slow hopper to have the SS signal confined to the Amateur band.

Jim it's the same old tired refrain that eminates from the Techies, ranging from Dale Hatfield on down to the lowly Carl Stevenson. They just can't understand that ham radio has always been about doing things within it that the participants find a personal interest in doing. That pool of participants has always -and hopefully will always, the likes of W5TIT aside- contain that same percentage of persons licensed as hams who have as a primary interest, the search for new and better ways to do things.

I submit that such an attitude as demonstrated by Ed's posts does more to slow the very phonomena he professes to promote than it does to actually promote it. Absolute assholes like Stevenson damage it severely. People get fed up with such nonsense. There WILL BE NO large percentage of hams who do research on the leading edge of communications, just as there has never been. That research is mostly done by hams who are also employed in the same field that results in their leading edge innovations that affect ham radio. Most of us eagerly use the product of that research to improve our stations and abilities. I have not seen that change at all in over 45 years as a licensed ham.
Most ordinary hams (save the Kim , W5TIT type which unfortunately is the fastest growing segment of ham radio operators due to easy licensing - her description of the process, not just mine, tho I saw it up close and personal co ntinuously during the years I served as a VE)- most hams are innovators who can take the output of the techies, experiment with and adapt it, and use it to full advantage in their daily activities within ham radio, as so many are now doing. That's the way it has always been, and the way it will be until the ARS is overwhelmed with W5TIT's.

Ed -among many others who have jumped onto that sinking ship- should be ashamed of himself for spreading so much absolutely WRONG information about our service. It is simply incorrect, save, of course, the many and growing number of W5TIT's among us. That attitude is far more destructive than any other I see today, except again, the "I just want my license to talk and am not in the least

interested in anything whatever that is in any way technical" attitude exhibited by, again, W5TIT.

We're still waiting for Stevenson to relate what digital modes he use to work those 70 DX countries when he finally, after a lifetime of moaning about his fate, reached full HF access. I suspect we'll be waiting a long time.
He's as phony as a fourteen dollar bill, for he cast aside all that digital dogma in favor of stuffing a microphone in his face. I for one am not the least bit surprised.

Little Dick, *you're* the one who most recently asked the question about when hams could/would have the technological capability to transmite images, even down to HF, from disaster situations--when the technology is already here and surrounds you. My description of the process is that CW is not required to produce a technological ham--in fact has nothing to do with it. My description of the process is that, since ham radio began, there have been technical hams and non-technical hams.

Now, it's your turn to try and look intelligent. In what way do I not use experimentation to its full advantage in my daily activities with ham radio? Huh? Why don't you just try to answer that one. OH, OH, OH...you mean *I* am not the one doing the experimenting?! Ah, so now if one isn't doing the experimenting, they also don't use ham radio to its fullest advantage? I beg to differ. I take full advantage of experimentation, every time I spend money on another new radio. You might say my kind is the kind that keeps manufacturers interested in that experimenting and in producing great products for our hobby, hmmm? Didn't look at it from *that* perspective, did you? However, I doubt you appreciate that perspective either. You know? Carl Stevenson sounds far more intelligent than you and I bet he experiments a lot more than you--based on how intelligent he sounds vs. how, well...non-intelligent you sound.

>

I'm still waiting for one of your posts to sound even the slighest as
technical as one of Carl's. While he speaks way above my head, even if he's
full of shit--it sounds better than anything I've ever seen from you. Hell,
the stuff I've posted at times is better than anything you've ever posted.
At least I knew that imagery transmission capability has arrived on the
scene *and* can be done from the talkie of an operator at that!

Tell ya what, Mr Intelligent Little Dick. Why don't you 'splain it to us?
Can't? Awwwwwwwww.... Maybe you're not what you think you are. (By the
way, I bet you're pretty much the *only* one who thinks it, too).

Oh, no, I wouldn't understand your explanation. However, I wonder if you
can even begin to make it sound as intellectual as Carl can and, in the
event that you may be right, I'm sure there's folks on this newsgroup who'd
know whether you were right or not.

So, humor us. Why don't you give it a shot, hotshot?

Of course that would depend on the spectral power density, wouldn't it? The stuff I see has far too much of that to coexist with anything, it blanks out normal activity on the band. It is strong enough to wipe out weak PSK and other amateur signals.
I know, it's not "conventional" spread spectrum such as is being discussed here. I have no idea what it is or where it comes from, but it sure isn't random noise. And my spectral display is only <3khz wide (digipan), so I have no way of measuring the frequency spread. But I know if that sort of signal becomes a regular and frequent occupant of the 20 meter band it will soon become useless for amateur radio use. So far it has been in infrequent short bursts
BTW, these observations were made at the edge of a metropolitian area of some 3 million residents.

Thanks for your reply Dick. But don't you think you could have made your point without perpetuating the enmity between hams here? If we could separate the lambasting (on both sides) from the issues, I think we'd actually see more agreement in goals. What kind of response do you expect to receive to your ideas when you expend so much verbiage calling people names? You discredit your own point of view. You negate the validity of the point of your argument. If you want to shoot down someones argument, do that. But calling them names doesn't work. It's not a valid counterargument. Who wants to listen to an angry namecaller?

I don't know what you hope to accomplish by talking about "tired refrains from techies". What do you call the guys who have always experimented with radio? Weren't the guys who developed SSB and RTTY the 'techies' of their era?

Cecil and Carl know they can say anything they want to you, Dick, because they know you don't argue effectively or rationally against them. I think you can, but as often as not, you dilute it with a bunch of namecalling. Try editing out all the personal stuff before you send. You might find you'll see less of it in their replies to you. On the other hand, maybe that's what floats your boat. I don't know.

Best 73, and I look forward to the next RRAP CW net.

I took, and passed my technicians license exam this morning, and now I am ready to shop for a decent rig or two, So far most of the mobile rigs I have seen do not have SSB. I have a HT I was given for a x-mas gift, and am looking now for a rig for my vehicle, and for my home.

Any advice would be most welcome.

So what's the beef?

>Especially since,

W0EX

>and I are diametrically opposed to
>each other so it is highly unlikely that we would ever see a matter from the
>same perspective.

It is "a thing" in a newsgroup, will never ever have any impact on your life,
and doesn't affect me one way or the other. W0EX, or anyone else for that
matter, could be the nicest person to walk this planet--but if you're never
going
to meet him, never going to be impacted by anything he does or says, then
why would you concern yourself with the matter?

>Ham radio could fill to the brim tomorrow with people who
>act in manners that

W0EX

> finds abhorrent and I have absolutely no
>problem with.

>To

W0EX

> ham radio would then be "dead." To me, it

All I know of you is what you write here and perhaps a few old emails. What you write indicates who you are, like it or not.

>Secondly, you've always impressed me as a much more
>logical person than to think that you can surmise a person's id without ever
>having met them, known them, etc.

I don't know if you mean "id" in the psychological sense or "ID" in the identification sense. I think it's the former.

> I stand corrected on my impression of
>you.

Why? All I'm doing is making a logical conclusion based on your behavior. You are VERY resistant to new information that disturbs your view of the world. So resistant that you spend much time and effort avoiding such information. I see nothing to contradict that conclusion.

> Thirdly, I think I've commented enough on the Carl Stevenson issue. I
>have read some of the debate, have seen some of his responses, seen some of
>others' responses, and I have decided that your idea of Carl Stevenson is
>different than mine.

Sure. I have more information. But I don't think you even know what my idea is.

> I've never been one to let others choose the way I
>think of other people.

Who is trying to do that? Not me.

>Sorry that disturbs you to the degree you display.
>It will leave me forever puzzled but, believe me, I'll hardly dwell on
>it...just as I will no longer dwell on the Carl Stevenson matter.

Doesn't bother me at all. Tells me a bit more about you, though. Like the way you resort to nasty plays on people's names, a'la a certain other poster here.

Then why did you say that you won't see it on the band unless you look for it
with a spectrum analyzer.

> I know, it's not "conventional" spread spectrum such as is being discussed
>here.
>I have no idea what it is or where it comes from, but it sure isn't random
>noise.

If spread spectrum, it would do one of two things -- occupy a large chunk of
spectrum simultaneously, using a PN code, with a slower data stream
superimposed over that code. (DSSS).

It could also be frequency hopping. If it were hopping pretty slow, you would
see it show up as pips on the analyzer display, at various places on the band,
probably spread out a bit due to the data being modulated onto the signal. If
it were fast hopping, it might appear pretty much like the DSSS signal I
described above.

If it is spread spectrum on 20 meters, it would probably be a slow hopper.

> Of course that would depend on the spectral power density, wouldn't it?

What PSD did you measure at the input to the analyzer?

>And my spectral display is only <3khz wide (digipan), so I have no way of
>measuring the frequency spread. But I know if that sort of signal becomes a
>regular and frequent occupant of the 20 meter band it will soon become
>useless for
>amateur radio use.

It very well be amateur use. In some nations of the world, the regulations essentially say "this is your band -- stay within it.) If you are using a digipan to record the signal, there is no way to know if it is an SS signal or not, although the short nature of the bursts do suggest a hopper. I have heard similar signals on 40 meters, sounds like about a second or two of "brrrrp" every few minutes. I have wondered whether it was amateur or an intruder.

> BTW, these observations were made at the edge of a metropolitian area of
>some 3 million residents.

It could also be radiation from any of a number of digital devices, some of which may be in your very home. :-)

Roll should go have a talk with Miccolis on what is being "seen."
According to Miccolis all the numbers point to "increases in
numbers of code-tested licensees."

It is very confusing to others to have one individual insist something is
one way while another says it is completely opposite.

>The "newcomers"
>I've seen in the post-Restructuring era are not making any effort
>whatsoever to learn the code, beyond passing the 5 WPM test to
>attain HF voice privileges.

Why should anyone bother to increase their morse skill beyond the
regulations? Roll has shown no sign that he has increased his
radio technical skill other than occasionally buying some ready-
built equipment.

>They are definitely not getting on-the-air with CW.

Again, there is no reason to...other than the jabbering of some
self-promotional control-freaks who demand that newcomers do
exactly as they did and "demonstrate their worthiness" to be in
the company of such noble, glorious elite gods of radio.

>The code testing requirements have been largely voted out of
>existence by lazy, indifferent people who seek only the immediate
>power of HF voice privileges, without the effort required to learn
>a valuable communications skill.

Among all those "lazy, indifferent people" are almost the ENTIRE
radio world outside of amateur radio in-group who are fanatics and
devotees of 1930s operating standards.

The label "valuable communications skill" is false...applicable only
to those who have some terrible need to regress to the 1930s and
remain there...or to those selfish and self-glorifying "better-than-you"
idiots who have a terrible need to elevate their importance far beyond
anything reasonable.

>This will ruin the ARS as we know
>it, by eliminating it's role as a means of training well-balanced,
>knowledgeable communicators, and replacing them with technically
>uninvolved, marginally capable appliance operators who will not
>have enduring value in challenging communications conditions.

That may ruin the ARS as Roll and his ilk "know it" but Roll and his
ilk should realize that they do not regulate or control any radio
service based on their own personal accomplishments.

One can picture the "highly-skilled" morse operator sitting in
front of his ready-built, top-of-the-line "appliance," never
venturing behind the front panel. If they did, it would forever
destroy their self-esteem to reveal they are, as a general rule,
technical morons, brag queens who can barely do a simple
Ohm's law calculation on a DC circuit.

How does morse have "enduring value in challenging
communications environments?!?" Perhaps in 1930 but NOT
in the new millenium. The rest of the radio world has GIVEN
UP on morse methods. Its only "enduring value" lies in
bragging rights for those who once passed a morse test.

Opinion given with the kindest regards,
Len

Hi Ed,

It is always good to see long-timers' comments on the halcyon days of amateur SSB, especially so from those who had first-hand, hands-on, practical experience in the 1950s. Praise aside, I'll make some comments on the "state of today's (or last week's) radio art."

SSB was already proven as a minimal bandwidth form of AM in landline telephony (frequency-multiplexed "carrier" equipment) prior to 1930, then during the 1930s in HF radio for radio-telecommunications carriers. The adaptation of SSB techniques to single-user, single-channel radiotelephony was probably hampered more by quartz crystal manufacturing technology prior to WW2 than anything else. Post-WW2 quartz availability was sponsored in part by military needs for FM radio, not SSB.

Early single-channel FM radio was more PM than direct FM, a phase-modulated crystal oscillator multiplied in frequency (over 50 times) such that the final signal was indistinguishable from FM. Quartz crystals were needed both for final carrier stability and for rapid QSY in vehicles (tanks) in motion. Single-channel SSB needs even tighter frequency stability for HF as compared to FM/PM on low VHF. Since long-haul military communications on HF was already using commercial (12 KHz wide) SSB carrier equipment at the entry of the USA to WW2, radio developments favored quartz crystal production, first for the "channelized" push-button-QSY vehicle radios then the VHF field radio relay sets. The ubiquitous "FT-241" crystals on the surplus market in the 50s and 60s were the left-overs of military FM set production.

Post-WW2 quartz crystal technology developed crystal-growth techniques to increase quartz availability and purity. That

technique was a sibling of crystal growth that had begun for producing germanium and silicon crystals for semiconductors. In addition there was an emphasis of general L-C oscillator design for frequency stability in harsh environments in that same period at frequencies ranging from MF to UHF. That happened in the entire "radio world" for many radio services in the immediate post-WW2 era.

Contrary to popular ham mythology, single-channel SSB was not "invented" by Collins Radio nor by "the amateur community" but rather a need by the USAF Strategic Air Command for a long-distance HF aircraft communications method at the start of the Cold War. The first Collins sets for SAC utilized a combination of stable L-C and quartz crystal oscillators to insure being able to listen as well as transmit on correct frequencies. It also gave Collins an outlet for their "mechanical" IF bandpass filters that were originally intended for the long-distance telephony carrier market (but did not fare well up against the growing digital multichannel telephony carrier equipment).

Some "true" innovation in ham radio technology can be said to occur first in the UK and Europe during the beginning of the 1970s. The "Zero-IF" or "direct conversion" receiver begins that era, something that had almost become a ham fad in that region at that time (see various issues of Radio Communications for many examples). The next might be the Gingell polyphase network written up several times: Mike Gingell's description in Radio Communications in 1973, then G3PLX's experimental SSB phasing modulator described in Radio Communications in 1975. Gingell's PhD dissertation (Univ. of London, 1975) is further proof as well as several articles in IEEE Transactions on Communications during the 1970s.

A second area of technology is the extension of quartz crystal ladder filter design from being a mystery within a sealed metal can, information held as proprietary to the crystal manufacturers, to assemblies of individual, matched crystals on a PCB. This was in the 1980s and included several articles in QST and QEX that was sure to have promoted more work in that area. It is worth it to note that the Stoner Goral Company (SGC) used that form of individual quartz units as a SSB filter in their maritime-amatuer market SSB transceiver. That appeared in several other company designs in both kit form and in ready-built transceivers.

The Numerical Electromagnetic Code (NEC) was released in the 1980s but lingered in limbo before being adapted by a few for more widespread use in modeling antennas. Roy Lewallen should get more credit for his initial work in reprogramming and making it available as a relatively easy-to-use antenna analysis tool (ELNEC and EZNEC). Credit should also go to L.B. Cebik for his promotion of NEC methods for antenna design and analysis.

[no one except Cecil seems to look in on www.antennex...?]

Some [Gary Coffman, et al] have promoted APRS as an innovative adaptation of GPRS although that is questionable as a true innovation. Automatic position location and reporting was already in the NAVSTAR planning in the early 1970s; NAVSTAR was the precursor to GPRS. A number of corporations were already at work on position location and reporting of vehicles of all kinds in the 1970s using systems not based on satellites (Minneapolis-Honeywell, RCA Corporation, Bendix, Sperry, etc.).

Store-and-forward message relay in amateur radio satellites might be an amateur radio innovation except for it being an extreme specialty application and a satellite becoming an extension of an "external infrastructure" that does not fit the "acceptible" criterion of individual, personal communications methods as described by J. Herman.

The burning question in my mind now is "when is the next regenerative or super-regenerative receiver article going to appear in QST or QEX?" I am always eager to see innovation in simplicity and economy in new radio technology. :-)

With all kind regards,
Len

Hi Keith,

Congratulations on passing your exam and gaining your new privies.

>I
>am ready to shop for a decent rig or two, So far most of the mobile
>rigs I have seen do not have SSB.

Most mobile rigs offered by "the big three" are of the narrow FM variety since the majority of folks on 2m seem to prefer repeater work. There are some all-mode base rigs that incorporate 2m along with HF, but they command a hefty price tag. You can use a transverter with a 10m rig. As for 6m, the new RCI-5054 seems to be the logical choice for a mobile. Again congrats. Take care and 73.

Whoa, what have I been missing here?! This sorta reminds me of the TV series about the hospital with Mandy Patinkin. I don't remember the actual name of the show. Mandy Patinkin's character gets into an argument with another doctor until finally the other doctor reaches out and shoves Mandy Patinkin. Game, set, and match to Mandy Patinken's character. Thanks for the entertainment, guys. Take care and 73.

> with a spectrum analyzer.

Well, why would you be looking on a band without a spectrum analyzer? The point
was that you wouldn't know as much about it's
characteristics by just hearing it. This thing LOOKED like a data signal , you know
how a signal that is modulated shows the modulation as alterations to the displayed
RF, and the amplitide appeared constant accross the entire display and presumably
well beyond. Wish I had had a real specgtrum analyzer looking at it at the time.
One can't predict this sort of occurance.

> superimposed over that code. (DSSS).

Looks like DSSS, it has no pips as FHSS, but shows characteristics of data
modulation, probably highly compressed, and sent at high
speed in a few short bursts which do not repeat.

>
>
> It could also be frequency hopping. If it were hopping pretty slow, you would

>
> If it is spread spectrum on 20 meters, it would probably be a slow hopper.
>

Of course I don't know what it was, nor the source. But it appeared to be a wideband data stream in a short series of bursts that completely filled the ~3khz spectral display. I'm fairly familiar with noise sources, and it was once a part of my job to find and deal with them. I'm aware there's a lot of new ones, and some of them are RF based, as I believe this one to be. Note that it showed up, did it's thing in a very few short bursts, departed and stayed gone. The signal showed the sort of data characteristics seen in modulated signals, from alterations of the RF signal displayed. Of course it could be the result of an intermod, but across a broad spectrum? I doubt it. It sure isn't one of the usual nose suspects that come and go, and are easy to spot. Of course there are plenty of those, too.

>
> > Of course that would depend on the spectral power density, wouldn't it?
>
> What PSD did you measure at the input to the analyzer?
>

??? As I noted the spectral display was the digipan "waterfall display". It was equal in strength to most of the PSK31 signals being displayed. It instantly filled the display with raspy sounding signal that appeared to have contained high speed probably compressed data. One does wonder at the source of such stuff.

> It very well be amateur use.

To me it looked more like some highspeed compressed data signal that passes a lot of data at very high speed. Could be military. I don't know what sort of use is made of that sort of thing under Part 15 these days in metro areas, but nothing would be much of a surprise anymore. FCC opened a real can of worms with that NPRM. It was the only time I ever wrote my congressman over a pending FCC action. Evidently they convinced him there was no problem. Who is to say there is, when you can't ID such signals? When their duration is so short term maybe there really is no problem, just a curiousity.

> In some nations of the world, the regulations

Don't think so, I've seen enough of that sort of stuff to get a pretty good feel
for it. Some of these signals are different. My bet is that this one was intended.

So what is it that suggests to them that each and every one of us should strive to become a digital-mode designer? Look at the history of the ARS - Invariably advances in technology are never adopted on a sudden basis. It sometimes looks like the people who do all the complaining about hams never turn on a rig and thus have no idea what actually goes on.

Yeah, and watch this "convenience" see the demise of DXpeditions!
DXpeditions rely heavily on income & donations that is included with the
request for a good ol QSL card.

I hope you advocates of e-QSLing have already worked the rare ones on all
band/mode combos, coz it'll be a different ball game now.

Hi,

I just ran into an old acquaintance and fellow ham who has developed a (commercial, not amateur) wireless internet system (WAN?) with multi-thousand subscribers. He had some interesting comments to make about his system during my interview such as:

1. most subscribers are stationary (ie. point to point) with gain antennas.
2. he does not worry about such things as keeping the power down to milliwatts.
3. he operates in the gigahertz hinterlands.
4. he uses good stuff (some of it mfg'd by Carl's old employer).
5. he provides 100's of Kb bandwidth per customer.
6. he is not too concerned about privacy, because of SS and other encoding technique
7. he does not spend on advertisement but is selling subscriptions like hotcakes.
8. says he is eaten up with computer gear managing T3 heads to the backbone.

I am sure he would be glad to discuss the characteristics of his system further if any would be interested.

Considering his system, it seems to me that the subscribers are those who desire high bandwidth, and cannot get it anyother practical way (no DSL or two way cable in their area?). His coverage area seems to be operated like a mondo-cellular system (lots of power, big towers, little overlap), with microwave interlinks.

Unfortunately for amateur radio, that probably would not be
a current concern for 20 Meters if HF access policy had
maintained the CW requirements, diluted, and effectively
dismissed on April 1.

If I remember right, what you brought to rrap was, "CW gets through when
no other mode will." But it doesn't on 10m at night at the low of the
sunspot cycle. I believe if you had uttered reality based statements,
instead of PCTA bromides, nobody would have jumped on you.

It could also be UWB. Here is another techie system that
has purpose and utility in the ether world. It is a good
way to communicate to minimize those pilotless
hunter-killers getting a fix and sending a hellfire missle
down your antenna.

Horsepucky, yeah, SS won't booger a narowband guy as much as will
another thumping narrowband transmission right next to the first guy.
Instead SS spanks some beaucoup number frequecies equally which narrow
modes do not. It's called SS trashing the whole band between it's
lower and upper spread limits with noise.
>
>
Yeah, I understand all of it. PSK31 can dig maybe 10dB deeper into the
noise level than I can with my ears when running CW. Plus PSK31 is a
narrower mode than even CW is at useful speeds. So why bother with SS
if the really big deal is minimal co-channel interference given the
fact that PSK31 is already out there?

> radios)

>
>
Heh. Depends on how you define "near future". There is absolutely no
question in my mind that, for instance, SDRs will become a major
player in ham radio. The big unknown is WHEN and your crystal ball is
no less fuzzy than is my crystal ball. The difference between thee and
me is that I long ago bought into the much bigger "paradigm". Which is
the blatently obvious fact that the general nature of ham radio in
this regard is it's ungodly slow rate of acceptance of all new
technologies and/or spectrum-management schemes on broad scales. Those
who don't pay attention to the lessons of history are doomed to heaps
of frustration and repeating bad history. You're a current-tech
iteration of Cervante's Don Quixote is what you are good buddy. Go for
it, oughta be entertaining as hell.
>
>
I venture to guess that in fact I've used more current-tech equipment
on the HF bands than you have. Hmm? I spent a whole evening surfing 40
cw with a Kachina operating into a three-element yagi at 150 feet. The
Kachina is certainly not an SDR but it was a great lesson in the
foibles of I.F & audio DSP as it exists today. The selectivity SUCKS
in critical ops like chasing the weak ones on 40 cw. Art Collins'
1950s 500Hz mechanical marvels kick the Kachina's butt in a huge way
given the same mission. Ditto the whizzy "40-bit DSP processing" or
whtever the hell it is in the I.F. stages of my own JRC NRD 545 rcvr.
>
>
If "you people" can't even beat what Art did in the 50s yet just at
the I.F. level make a rough guess how long it's gonna take to have
decent DSP front ends . .
>
>
>
>... read the FCC's recent docket items on SDR ...
>
>
That's old hat, gimmee a break. Has nothing to do with ham radio, we
don't need to apply for "dynamically-issued permission slips" from the
FCC to change operating freqs or modes, we don't use commercial
type-accepted radios.
>
>
> Try as you might, you're not going to be able to keep ham radio
> stuck in the past forever, and attempting to do so is harmful to
> the ARS.
>
>
Sure, as if I'm having any impact at all on ham radio. Like you have
any impact on ham radio. I have no interest in "keeping ham radio in
the past" at all. I'm just realistic enough to understand how long it

takes for the past to go away via mechanisms neither thee or me can do
a damned thing about.
>
>
>
> It's a well-recognized fact that the emergency management folks

Is RTTY not "real data comms"? Ham RTTY was out there in volume back
when I was wearing corduroy knickers. OK, so thoses were Model 59 and
big tube radio days and RTTY was not a practical consideration for
onsite emergency ops. RTTY is still out there in volume and all ya
need to run it today is highly portable equipment like a little
solid-state xcvrs and a laptops with sound cards. RTTY is a crude mode
by today's standards but to the best of my knowledge not even RTTY has
been deployed into emergency comms to any recognizable extent. You
tell me why not, beats the hell outta me.

I have yet to bitch on the technical characteristics of any mode wide
or narrow just like I'm not stupid enough to argue with physics. My
ONLY bitch is on your oft-repeated concept of "layering" SS over
spectrum space known to be commonly used for narrowband operations. If
there's a "technical flaw" around here it's your contention that SS
will not significantly degrade the noise floor for narrow mode users
in spectrum space "shared" with SS. That is not a flaw in SS
technology, that is a flaw in your HEAD.

I didn't say it was any "paradigm for the future of the ARS". It's
straight-up late 70s stuff implemented to take advantage of early
desktop computers and it hasn't budged very far away from that
"paradigm" since. I essentially said that the newer 2m FM mobile rigs
with data ports are an enroute "band-aid" for the current 2m dx spots
system. Period. Which system is only one weenie little very
specialized corner of ham radio. We don't generally consider packet to
be "real ham comms", it's just an old taken-for-granted utility sorta
no brainer no-counter thing. Jesus Carl, get yer blood pressure down
before you explode.
>
>
> what's
> needed are radio modems, purpose-designed for transmitting

I'll vote for that. And they are out there. We have ONE quasi-9600bps
70cm link in the whole NE corridor spots system. It does not run at
"9600", not even close and those modems are expensive, too expansive
for Joe the dxers to be bothered with, they'd all rather endure a
system crash once in awhile than pop for retooling the whole system.
'Nother lesson in reality.

There's just a few other aspects about K1MAN's
operation that need to be known Clay;

1) K1MAN is not a legitmate bulletin station per-se.
He may say he is, but until he produces a Notarized
Charter or Mission Statement. ARRL on the other hand
can produce legal, court admissible documents which
can attest to their status as a Legal, non-profit, N.G.O.

2) Try telephoning his number sometime. At *no point* in the
recording did I hear any verbal indication that any
and/or all callers comments are subject to airtime.
It's just an answering machine with the usual "leave a message"
greeting.

Nah. They'll just require a "donation" via Paypal before your call shows up on
eQSL's "service."

Just think... you not only need a rig and antenna, you'll need Mastercard too
<g>.

I think I'll stick to green stamps and mail. I like getting 'real' QSLs and I
give the incoming DX stamps to the neighbor girl for her collection.

>SSB was the radio art of the day.

Actually, it was quite "old radio technology" by 1950.

AT&T's LF transatlantic
telephone system was SSB from its very start in the 1920s (antenna bandwidth at 55 kHz, among other things). Some hams were on the air with SSB in the early 1930s (W6DEI and others). Commercial HF SSB was being used for telephone service in the 1930s also.

W1JEO's exciter was used MOBILE, by the way. I don't know if any other service was running mobile SSB in 1950 - I don't think so. Almost a decade later,
manufacturers like Collins offered hams "mobile SSB transceivers" like the KWM-1.

My point in mentioning that exciter was not to claim that hams invented SSB but simply to point out that the advances were in the form of simplification and
economy. I don't think any commercial outfit or manufacturer had a mobile HF SSB exciter using only 4 tubes - at least not in 1950.

>What similar advances in simplicity and
>economy have hams done to the state of today's radio art?
>
Well, there's APRS, and PSK31, and satellite communications with relatively simple gear, to name just a few. Last year, if I recall correctly, there was a 24
GHz amateur EME QSO using relatively low power (well under 100 W) and small dishes. (2 meter diameter?).

That's just the stuff I can think of right away. There's lots more, of course.

Back in those days there was a regular column in QST called "On The Air With Single Sideband", too.

Yea, Phil, but who's going to know as long as the Third Party doesn't screw up?
:-)

I know, they looked at a case like that not long ago.

Yeah, we know there's a LOT of comm systems out there that we haven't been told about. I suspect it may be something like that.

You may be right. From long experience I knew that CW would indeed be able to get through after all the other modes commonly in use -you know, (and knew then) SSB, AM, FM etc. have faded into the noise. I know that from doing it with CW, not from some "bromide" I swallowed. I guess that can't mean anything to those who can't have had that experience. But it wasn't that fact, it was the response of those who simply refused to accept things as they are and instead substituted their own "bromides".

My "reading" --- you are certainly making the jests, senor.

When I was routinely inspecting mountaintop TV transmitters which
were required to have an operator on duty at the transmitter in
those days, within a two year period I caught three operators
asleep, and heard much better excuses than that. Alas, it did them
no good and I cited both the station and the operator for the
violation.

No. I can tune less than 5 kHz away from an s9+20 ssb signal on 20 and
all traces of that signal are gone. It's the "gone" that matters, not
just 30db down, GONE or he's no better than some dork shipping key
clicks. An offense for which you can get cited.

This is a shot in the dark but it looks like your primary interest is emergency comms. SSB in the vhf/uhf bands is generally used for weak-signal dxing on those bands, not for emergency work. I don't know of any organized emergency comms around here which use six meters at all. Most emergency comms and recreational yakfests are carried out with FM on 2m.
>
>
But to specifically answer your question on the home station side of the coin there are at least two multimode rigs out there which will operate ssb on both six and 2m. On the high end there is the Kenwood TS-2000X which provides the ability to run cw, ssb, am, fsk (data) and FM voice & data in the HF, 6, 2, 70cm and 23cm ham bands. It can get you on 10m with a Tech license plus it's a good swl rcvr. For over $2,000.
>
>
A much less expensive possible solution for getting on both ssb and FM on both six and two meters is the $700 20w Ten-Tec 6N2 which can be used to run cw, ssb and FM.
>
>
But for a couple hundred more bucks the Icom 706 does it all as Cecil indicated and with decent power output on six and two meters. If I was a Tech and not particularly interested in weak signal ssb work on the vhf/uhf bands I think my choice would be one 706 for the vehicle and another one for the home station.

And, to address the technical aspect of your "conclusion," I would say that if one cannot hear a signal but can only see it on a spectral display, then it could co-exist with narrowband operation, wouldn't'cha say, Clay?

Of course, the original premise was flawed -- a signal that can be seen on the crude spectrum analyzer he was using WOULD be audible, but that subtle point seemed to have eluded you. Of course, that wasn't said by someone you feel represents ARRL policy, so you wouldn't have attacked it anyway. :-)

You climb mountaintop I think you frustrated with not
understanding rule & regulation and you cannot catch people sleep
as they already in imobile horizontal postion. You really need to
study your regulations better before you try to make statement about
them!

> Sick......

As I tell you before, if operator sick then that mean regulation is
Ok. You are still reading regulation wrong, not interpreting it
correctly and then you make crazy statement all wrong. I always tell
my students to research very carefully before making statement about
rule & regulation. You make wild incorrect statement!

Best Wishes,

Randall

Thanks to everyone who has offered advice. While I am into emergency comms, I am also a radio hobbyist. I started out on CB and fell in love with working SSB, I am also very interested in low power work, I know most QRP is done in CW thats one thing thats pushing me to go with lewarning code and getting my general ticket, that and as has been pointed out, code will punch through when nothing else will.

That's what happened to me ;-)

At first I thought that Bill's statement couldbe lumped under "education",
but now I see that it stands on its own.

I would add that the stepping stone doesn't have to be into radio engineering,
either. Or even EE in general.

Exactly! The advances are more in the application area.

>
>Remember too, that was during a time when the typical receiver of
>any consequence was probably the dollar equivalent of well over $500
>in today;s dollars.

It wasn't a receiver. Just a low-power transmitter. W1JEO actually used it
mobile, feeding a pair of 807s in the trunk.

The cost factor is an important one. On the one hand, modified surplus and
homebrew gear could get a ham on the air for a few bucks. Manufactured
receivers started at around $50 and a decent new rx was in the $150-200
range. Inflate those numbers to today's prices and $500 is about right. Just
for
a receiver!

>Many "do-it-yourself" articles then were targeted
>at inexpensive way to get on the air...in terms of typical incomes
>of the 50's.

However, the economy of building one's own back then was driven mainly by the
availability of parts at less-than-net prices, and the elimination of the
hand-wiring
labor cost. In many cases a manufacturer could make a piece of ham gear
cheaper than it could be homebrewed with all new parts.

Kit rigs appeared in a big way in the early '50s and proved the point
decisively.

>> I think part of what the FCC is trying to say is that if hams limit

Which is where?

>Repackaging old parts when there's a host of inexpensive, quality
>commercial gear available isn't likly to result in any real new
>advances (IMHO). More likly advances can be done in software
>for equipment too.

But most hams aren't going to start at the cutting edge, or anywhere near it.
Most
will start with something basic and work up to more advanced stuff. What's
needed are projects at ALL levels.

Hi George,

Yeah, I did kinda jump the gun. I do use a President Lincoln (Uniden HR-2510)
with a Ten-Tec transverter for 2m SSB. I'm also using an AR-3500 as my interim
10m rig until the FT-840 finds its way out of the carton and into the shack
this spring. Take it easy.

I recall exchanges where you discussed putting SS on amateur HF and VHF
over top of existing users, but discounted the idea that narrowband users would
be adversely affected. In other posts you expounded the opinion that if they
were adversely affected they should simply abandon those old "legacy modes".
>
>Furthermore, the discussion in this thread for MANY days has
>been focused on 2.4 GHz and the applicability (or not) of
>modern technologies (such as, but not necessarily limited to)
>802.11b to ham radio ...
>
It hasn't been specifically limited there, though.

Let me make it clear that I am all FOR amateurs making more use of their
alloctaions, particularly the ones like 2.4 GHz that are currently far
underused
by hams. I think an amateur DSSS network on 2.4 GHz, probably based on
802.11b would be a GREAT thing - a giant leap over current packet stuff.

>Having said that, many of the underlying principles, like CSMA-CA
>or others, that are used in "real world" communications systems
>could be applied to amateur digital systems in the HF bands as well.

Maybe. The devil is in the details. For example:

One of my current HF transceivers is rated to have a 20 kHz blocking dynamic
range of 136 dB on 20 meters. In plain language that means I can be working
an S1 station while a local who is pounding in more than 60 dB over S9 is just
20 kHz away. Its 5 kHz BDR is almost as good, btw.

In practice this means that co-channel interference from strong signals is only
a
problem within a very few kHz, or when the strong signal gets REALLY strong.
(0dBm
neighborhood). The S9+40dB local a few kHz away simply doesn't cause a problem.

Suppose that S9+40 dB local is running 100 W of SSB and his signal is 2 kHz
wide. He's putting
50 watts per kHz into the ether, IOW. Suppose he switches to an SS mode that
spreads those
100 watts evenly over 200 kHz of 20 meters. Now the power density is down to
0.5 watt per kHz -
20 dB below what it was before.

But to a narrowband receiver, what has happened is that a single S9+40 dB
signal that used up a few kHz
of the band changed into an S9 +20 dB noise level over 200 kHz of the band.

Even if the SS station reduces power to 1 watt (20 dB reduction), the result is
a noise level of S9 for
anyone who previously experienced that station as S9+40 dB when narrowband.

Yes, this is a simplified example, but the PRINCIPLE is the same.

>
>WADR ..

I have no idea what "WADR" means. Explain?

>.any lack of understanding .. or simple lack of acceptance ...

I have neither of those lacks.

>on your part does not automatically negate the applicability of any
>(set of) potential technical solutions to ham radio ...

Never said it did. You misunderstood, that's all.

>Guess I missed the vote to establish "the majority opinion".
>When and how was it taken?

An NCI member read the comments and categorized them. Results
were posted here. The majority clearly wanted at least two test speeds.

That means most commenters were not only FOR code testing, they were
FOR more than the bare minimum 5 wpm.

FCC decided not to go with the majority, that's all.

>> FCC has been pushing for the end of code testing since 1975.
>
>Pretty slow progress for the entity that has always had the final
>say in such matters.

Not really. Only took them 15 years from first proposing the idea to
reality.

Here's one for the alternate-history buffs:

In 1975 the EIA wanted the FCC to reallocate 220-225 to a new "Class E" CB
service. Part of the reason for this proposal was to sell new sets (almost
everything sold to cb users up to that time would have been useless on 220).

But
another reason was to put a service intended to be for local communication on VHF instead of HF.

Of course hams fought it tooth and nail and eventually the FCC dropped the idea, and instead expanded 27 MHz CB to 40 channels.

One wonders what would have happened if hams had taken a different tack, such as "OK, take 220 but give us back 11 meters" or some such.

Yup - but the FCC doesn't care about that. They have other fish to fry.

Consider the medical waiver thing. FCC has to handle all of those because who
got a medical waiver is NOT in the public database. FCC just wanted out of it.
>
>>Note that FISTS and the ARRL

>been made to get the FISTS organization to live up to it's title.

Doing so would have opened up a whole can of worms best avoided.

--

I think there's another motive that the FCC is acting on. One of their
biggest problems is pirate stations - bootleggers, freebanders, whatever.
FCC figures that the code test is what keeps a lot of these folks out of
ham radio, so by eliminating it and simplifying the writtens there will
be more hams and fewer pirates.

Remember that it's much easier to do enforcement action against a
licensee than against a totally unlicensed person. You know where the
licensee is and who he/she is, for one thing.

>met the treaty requirement.

More importantly, it was NEVER challenged.

For the first 25 or so years of its existence the Novice was a short-term one-shot
"learner's permit" that was not intended to be a permanent license. The real proof
of Bill's claim is the Technician, which was also introduced in 1951.

>> >If S25.5 is repealed, the FCC will have to decide if an amateur
>> >radio operator is qualified without Morse code.
>>
>> Read the R&O to 98-143. They've already decided. By the look of things,
>> they decided long ago.
>
>Agree again.

I would say that the defining moment was in 1975, when the FCC (not hams or would-be hams) proposed a nocodetest ham license. The fact that the FCC would suggest such a thing on their own initiative indicates they had already decided

what the future path would be. 1983, 1990 and 1991 only reinforced that path.

1. You will have to prove that you have a Plus, they are renewed as Techs so photocopy the old license. This will give you code credit. You are and will be on the data base as a plus until 2006.

2. Depending on when you got it, you may or may not have to take Element 3. If you had it from the days when Techs took the same Element 3 as the General, you need only do the paperwork. From the callsign, I doubt this is the case so plan on two writtens.

3. Sample exams at http://www.qrz.com or get the whole verstunken question pool from http://www.arrl.org

4. Bring your old license and a photocopy, a picture identification, and your checkbook.

You might want to check with the local VEs but in the Cities area, you should have exams on a weekly basis.

Dick NBK

3. While you are at it, take Element 4.

>I believe you will find that such FCC rulings don't PRECLUDE
>another repeater on the same pair as a coordinated one,
>but simply place the burden of resolving any resulting harmful
>interference on the uncoordinated one ...

Sounds just like "ownership".

Repeater A is coordinated, but Repeater B is not. Repeater B
is allowed to use the same pair as Repeater A ONLY IF Repeater
A doesn't experience interference from Repeater B.

If interference ocurs, B must resolve it, which usually means going
silent. If no interference occurs, A doesn't even know B exists.
>
>However, it still remains that no ham "owns" any particular
>frequency to the total exclusion of others. Again, read what
>it says on your license near where you sign ...

The effect is the same.

Here's another example: Stations A and B are having a contact. Stations
C and D show up and begin having a contact on the same frequency, even
though all stations can hear each other. Except in an emergency, do C and D
have the same claim to the frequency as A and B? I don't think so, and neither
does the FCC.
>
>Please don't try to twist this into some sort of statement

I repeat: If the system cannot hear all users on a given frequency it
will think that frequency is not in use - unless it can determine from
the content of the transmissions it can hear what the situation is.

You missed the point, Carl.

Given the choice between using a system based on existing rigs and one that
requires building all new rigs, most people choose the former. 'Specially when
they have limited time, money and resources, and success is not guaranteed.

First step is to get hams in the habit of actually building radio sets from the

ground up, or adapting available equipment to new uses. How ya gonna do that?

Often at a tremendous price. Look at all of the deadend stuff in the home electronics area - remember the original video discs, Beta format videotapes, etc.? Look what happened to the Iridium system.

In the case of roads, the effects of better roads have not all been positive.

>What will I have to do to go from Tech Plus to General Class?

That depends on when you took the test for Tech.

If you took the Tech before March 21, 1987, all you need to do is
got to a VE session, pay the fee and present your documentation
and you'll get a General.

If you took the Tech after March 21, 1987, you need to pass Element
3 (the new General written). Go to a VE session, pay the fee, pass the
test and present your documentation and you'll get a General. The
question/answer pool is on the web at several locations - just check
your favorite search engine.
>
>Will I have to take the CW again?

Only if you let your license expire for more than two years. Otherwise
you have code test credit for ALL license classes that require it.

Good luck!

>relaying messages when some begin moving out of range.

I tend to watch the simplex frequencies when I'm in a good spot. The
problem is that my QTH and its parking lot are riddled with lousy
spots. (As in, I can hit the 145.19 repeater with an HT and ducky
while I'm sitting on the hood of the car. Meanwhile, 50W into a
halfwave on the car roof is unreadable. Move the car three feet, and
it works fine all the way down to 5W.)

When the YL and I are running separate errands, we use simplex as much
as possible, since there's no way her 200mW HT is going to get into
many repeaters, and trying to coordinate which one to switch to if she
loses the one we're on is too much of a pain. OTOH, I've been really
impressed with the range it gets from a little $10 telescoping
antenna.

IMO, if they'd clear out the repeater subband, they could shrink it
quite a bit without actually reducing the activity level, and give us
more space for other things. (FM Simplex, ATV, SSTV, packet,
whatever)

>> Actually, I worded the original kind of badly; I'd rather see a 70cm

[we are not here to discuss Kelly's lobotomy...]

FHSS will work just fine in relatively narrow bandspaces. Hundreds of users can coexist that way. Hundreds of DSSS users in the same bandspace would indeed raise the local geographical noise floor. To properly discuss spread spectrum one needs to specify the TYPE of SS.

>>
>You copy-pasted that one from one of Lenny's posts dinya?

Impossible. I've never operated anything but a car radio (receiver) in Mexico. I've worked for the Rocketdyne division

of Rockwell International, NOT the Collins Radio division of
Rockwell International.

The misdirection that Kelly attempts is visible as follows -

>Has absolutely precisely NOTHING to do with ham HF cw and phone dx
>contesting and the related VHF ham packet comms, I'll stick.
>>
>> How is contesting relevant to this discussion?
>>
>You lost the thread AGAIN or what?? The topic was the dx spots system

Is the future of US amateur radio to be predicated solely on the desires
of DX-chasing and contesting?!?

Apparently so. Kelly has "established turf" and seeks to defend the
turf of his personal opinions, thus imposing his will on a half million plus
other licensees. Those who disagree or have disagreed with Kelly are
"discussed" with disparaging and denigrating commentary.

What does Kelly know of HF radio OTHER than the amateur bands?
How many modes and modulations has he "worked" OTHER than
those allocated to amateurs? What does Kelly know of the OTHER
EM spectra, in particular the US amateur bands above 30 MHz?

Nothing but CB on 11 meters? Oh, too bad. Kelly just doesn't
have a clue of OTHER RADIO.

Everything must remain just as Kelly desires it. No change. Nothing new. Nobody can change anything according to another part of this same post. RIP.

Deus ex machina in his Kachina. :-)

With all kindest regards,
Len (West)

>>... read the FCC's recent docket items on SDR ...
>>
>That's old hat, gimmee a break.

Kelly does not get a "break." The use of "break, break" in amateur radio communications is considered a violation punishable by threats of excommunication and no 599 report.

>Has nothing to do with ham radio, we
>don't need to apply for "dynamically-issued permission slips" from the
>FCC to change operating freqs or modes, we don't use commercial
>type-accepted radios.

Kelly does not seem to understand the nature of Software Defined Radio as an architecture within the radio system. It is not a mode in and of itself but CAN be used to generate any mode.

Under the present rules of US amateur radio there is absolutely nothing forbidding anyone to use an SDR radio on any band, by any class of licensee, at any time. None. Zip. Nada. All US radio amateurs, any class, must follow the regulations in regards to the allocated modes.

The concern of the FCC is with OTHER radio services and the regulations thereto. At present OTHER radio services have regulations that imply conventional hardware-defined modulations and modes. Since SDR can be configured to generate almost any mode, it would be any easy task for any SDR user to operate in an unallocated mode in one of those OTHER radio services.

Have you understood this as has been explained to you, Miranda?

>Sure, as if I'm having any impact at all on ham radio. Like you have
>any impact on ham radio. I have no interest in "keeping ham radio in
>the past" at all. I'm just realistic enough to understand how long it
>takes for the past to go away via mechanisms neither thee or me can do
>a damned thing about.

In the United States of America, the "mechanism" is built-in to the First Amendment of the United States Constitution. [in case that wasn't understood, some who prefer "turf rules" and "fraternal membership rules" do not like such freedoms...]

One can cite the recent Commentary on NPRM 98-143. Over 2800 separate submissions on US Amateur radio restructuring which were ALL made public. The power of the special interest group can no longer cow dissidents into submission.

There is NO excuse for APATHY in making one's feelings known to one's government. NONE.

With kindest regards,
Len

That SS is only for direct-sequence spread spectrum. Kelly tries to argue that present-day DSSS is "unsuitable for HF" without realizing what Stevenson said about chipping rate or that such a rate can be changed. Kelly does not acknowledge frequency-hopping SS at all.

>Yeah, I understand all of it. PSK31 can dig maybe 10dB deeper into the

Why bother with anything new that might upset Kelly? :-)

>But ya can't toss .jpgs around on 20 with PSK31 huh?

Non-argument misdirection. First, no one has remarked about images on 20 meters. Second, PSK31 is tailored to characters not images. Please try to study the origin and total system

concept of the mode before smarting-off with wisecracks.

Nonetheless, I've seen TTY character image pictures transmitted
by ham packet. Copies of what had already been circulating on
BBS nets. [sent via amateur radio they attain a special divine
status? :-)]

>the blatently obvious fact that the general nature of ham radio in
>this regard is it's ungodly slow rate of acceptance of all new
>technologies and/or spectrum-management schemes on broad scales.

Why is Kelly so proud to be part of the problem?

>Those
>who don't pay attention to the lessons of history are doomed to heaps
>of frustration and repeating bad history.

The lessons of history in the entire world of radio are that it is still
evolving and will continue to evolve. New technology abounds in
radio...now. The information is out there now. The unwillingness of
so many long-time hams to keep up with evolution is remarkable.

Those whose only "education" about radio is limited to amateur radio
technology are doomed to heaps of frustration...and venting that
frustration and ignorance on others in an effort to make themselves
appear as "superior." Their superiority is only virtual, within their own
minds, limited to boundaries set long ago but other "superiors" of an
earlier era.

>You're a current-tech
>iteration of Cervante's Don Quixote is what you are good buddy. Go for
>it, oughta be entertaining as hell.

Kelly appears to be looking in a mirror again. That erstwhile PA Sancho
Panza needs to park his mule and observe that those "windmills"
are only virtual constructs in the individual minds of the set-in-their-
ways, don-bodda-me-wid-whizzy-new-stuf long-timers. Windmills

are powered by air, something plentiful among the "CW gets through when nothing else will!" long-timers.

The rest of the radio world hasn't bought into those windmills yet. Not even maritime radio, perhaps the last holdout of "CW is the king of radio modes" aging champions.

>I venture to guess that in fact I've used more current-tech equipment
>on the HF bands than you have. Hmm?

Ordinarily I would rise to take that sucker bet. Kelly doesn't have the life experience to point to anything but the narrow spectra of amateur bands on HF. The rest of the radio world includes ALL of HF as well as decades of spectrum above and below HF.

> I spent a whole evening surfing 40
>cw with a Kachina operating into a three-element yagi at 150 feet.

The Kachina has been out of production for months...

>The
>Kachina is certainly not an SDR but it was a great lesson in the
>foibles of I.F & audio DSP as it exists today.

I would be interested in Kelly's even semi-objective technical data showing the above statement equivalent to "foibles." The Kachina was designed by other radio amateurs.

>The selectivity SUCKS
>in critical ops like chasing the weak ones on 40 cw. Art Collins'
>1950s 500Hz mechanical marvels kick the Kachina's butt in a huge way
>given the same mission. Ditto the whizzy "40-bit DSP processing" or
>whtever the hell it is in the I.F. stages of my own JRC NRD 545 rcvr.

Art Collins is dead. So is Bill Halligan. I doubt that Art Collins had any personal involvement in the design of the R-390 military receiver that began the legends concerning the over-priced Collins goods.

While digital signal processing may be "whizzy" to long-timers who know little of anything digital, they all work as designed if but only if they are CONTROLLED PROPERLY. A filter is a filter. There is nothing magic about the Collins "mechanical" filters nor about crystal filters that have sharper skirts. Extreme subjectivity is not a valid technical comparison.

>If "you people" can't even beat what Art did in the 50s yet just at
>the I.F. level make a rough guess how long it's gonna take to have
>decent DSP front ends . .

I doubt that ANY group can convince Kelly of anything once Kelly has his mind made up. :-)

DSP is ALREADY HERE. It exists, working every day in other radio services. No magic required. It just hasn't gotten down in the price

range of one-ninety-eight that some long-time hams feel "they deserve"
(for being so good and superior at morsemanship).

With kindest regards,
Len

That's ok, but I'd made a promise to myself. I wasn't licensed when I got the rig and I promised myself the rig would remain "in-box" until I had the appropriate privileges. Then I lost my den to my newborn boy. I'v been "allocated" a corner of the master bedroom to set up my shack. This happens to be the last room in which we have to finish the <wood> floor and paint. I have a temp setup for 10-meters as well as a 2m h/t that serves as a paperweight. (I checked out the 2m repeater scene and didn't like what I heard...so it's not my bag.) I should have the whole shebang up and running by summertime. Take it easy.

Remember, too, that as a Tech, if you take and pass the 5wpm CW test, it is only good for upgrading to General (with the General written) for one year. If you do not upgrade to General within that timeframe, you will have to take the CW test again.

145.190 is my "home" on 2M. I've been with Billy's machine nearly since
becoming a ham. You'll never hear anyone tell you what you can/can't talk
about on that repeater. If they do, they ain't been there very long! It's
an excellent machine with excellent range. It's up on top of the "curved
roof building" in downtown Dallas.

Speaking of 10M, I went out today to visit with my parents. Mom and I had gotten my dad a Radio Shack 10M rig for Christmas and he is blind, so could not figure out all the buttons, etc. I sat down with him and taught him all the buttons, gave him some pointers on SSB operation and suddenly heard a Icelandic station on 28.360!!!! TH____ (forget now). WOW, I couldn't believe it. I have heard 10M lately and couldn't believe I was hearing Iceland. I got to show my dad the example of longpath (didn't work) propagation vs. direct/short. He is a retired Chief Radioman in the Navy, so it's beginning to all come back to him. I don't know if he'll ever get to "chasing DX" or not, but I had him sit down and run the ship for a few before I left. You shoulda seen him catching signals and clarifying them in real quick...LOL

What do you teach, chaos or craziness?

I earned my living interpreting FCC regulations correctly and
teaching communications law...I even participated in writing
them and the enforcement procedures for them while I was on the
FCC's staff for three decades. I have no problem reading and
interpreting FCC rules correctly.

Keep it up, fella, your unfamiliarity with proper FCC Rule
interpretations and expressing yourself clearly are giving us
a good laugh.

>But another reason was to put a service intended to be for local communication
on
>VHF instead of HF.

Out of curiosity, just where was this "proposal" publicized OUTSIDE of amateur radio? There is a lot of seeming "spin" on that description.

The first CB "classes" (A and B) were up just above the amateur 3/4 m band. There was never a big demand for those even if they were begun early, in 1957. But, by 1975, there were plenty of bands on VHF and UHF for what is now the PLMRS group.

The Electronic Industries Alliance is basically an association of electronic systems, devices, and components manufacturers. Being in business, they are oriented towards making a profit.

>Of course hams fought it tooth and nail and eventually the FCC dropped
>the idea, and instead expanded 27 MHz CB to 40 channels.

Has there been a poll taken on dental problems and chipped nails in the "amateur community?" :-)

>One wonders what would have happened if hams had taken a different tack, such
>as "OK, take 220 but give us back 11 meters" or some such.

One thinks that the bitchers and moaners in the ham community were just passing the baton to the next generation on the complaints about "stealing 11 meters." While not being able to read minds or divine thoughts of the FCC of 1975, this one can only imagine that the FCC would look at 10 meters and see that radio amateurs had 1700 kilocycle/KiloHertz of bandspace from 28.0 to 29.7 just as open and UNSTOLEN then as earlier and still there today UNSTOLEN. Just how much bandspace of this precious 11 m band were "stolen" originally? :-)

On the other hand, I know that a large number of southwestern hams were busy making the gigantic repeater chain that stretches from north of San Francisco south through California and into

Arizona. Would they have agreed to "give up" 220 just to please some easterners who don't really acknowledge westerners? Look up Condor Net and check their history. Lots of innovation in that net, up and running, tone-controlled and path-guided without a single microprocessor in the beginning.

With best regards,
Len

That may be true but the fact remains that CW doesn't get through when the
band is absolutely dead. CW does NOT have supernatural powers. CW is, however,
one of the best QRP modes.

But Ed! That's saying that spread spectrum isn't a current mode because
it hasn't replaced other modes in common widespread use!

You'd be surprised how many times a band seems dead that isn't really "absoulutely dead" at all. If you don't believe it, try calling CQ several times on a 'dead' band and see what happens. You'll probably need to make several calls, but as often as not someone will hear you and answer. He'll probably be weak, maybe very weak, but he'll prove the band isn't really dead after all.

Steve:

That is completely unnecessary. All you have to do is actually *be*
present. The 10-year old can say your call sign just as well as you
can. It doesn't matter who's voice is used to give the call sign, as long
as the station is correctly identified at the required intervals. Your
"control op present" announcement may make you feel good, but it
doesn't matter whatsoever to anyone else...including any FCC
monitoring personnel, OO's, etc.

Well, you're right. If you were a Tech+ to begin with, then always a Tech+ you will be (unless you upgrade). However, according to discussion on our repeater, Bart Jhanke(sp?) with the ARRL confirmed that new Techs (post-Restructuring Techs) who get their 5wpm CW test under their belt *must* upgrade to General within a year after passing the CW test, or they must take another one.

This made sense to me, because otherwise, why not leave the license class Tech+? Now, I did not see the communication from Bart, it was relayed from a VE to the rest of us on the repeater. Does anyone else understand this differently?

4092. Cell Phone: Are they Safe? - My Research

Newsgroup: rec.radio.amateur.policy
Date: 2002-02-11 03:45:15 UTC
From: cellphoneemf@aol.com
Message-ID: <ee430f43.0202101945.715d7f00@posting.google.com>
Source record: 33501

I'm a graduate student at UConn, and I've done some research on the safety of cell phones. You can view my article at http://members.aol.com/cellphoneemf/. I'd love to get feedback. Thanks.

Article Abstract
There is discussion in both the media and public health arena in regards to the safety of cellular telephones. This is of grave concern given the popularity of cell phones. According to USA Today (8/2/2001), there are now 120 million cell phone users. This means that most adults living in this country use cell phones. Furthermore, the average subscriber spends 150 minutes a month talking on their cell phone, and this number will, most likely, increase as more people forgo their land-line phone for the better rates now being offered by the wireless providers. This paper explores the potential brain cancer risk of cell phones by analyzing the most recent epidemiological and animal studies. It also tracks brain tumor rates in the USA, comments on the political climate surrounding wireless technology and offers an introduction to electrical sensitivity.

4093. Re: Tech Plus to General Class

OK, here is the text of the area of Part 97 which I believe addresses this situation and, indeed, confirms that a CW test is only good for one year. See (b), below. Anyone read it differently?

By the way, not to start an all-out war here ;), but I think this "little point" is either unknown or often missed by the disgruntled who didn't like the Restructuring rules. It was much easier (at least as far as I am concerned) to advance to General Class prior to the Restructuring date, as any amount of time could go by after passing any of the tests. Now, any written test and the CW test is only good for upgrade for one year. Anyone who took and passed the CW test after the Restructuring date, has one year from that date to pass a written test for General--or they lose credit for the CW test. The same for the written. If you've passed the written test, you have one year to pass CW and upgrade to General--or you lose credit for the written.

I think it was a nice compromise.

Kim W5TIT

[Code of Federal Regulations]
[Title 47, Volume 5]
[Revised as of October 1, 2001]
From the U.S. Government Printing Office via GPO Access
[CITE: 47CFR97.9]

[Page 581]

TITLE 47--TELECOMMUNICATION

CHAPTER I--FEDERAL COMMUNICATIONS
COMMISSION (CONTINUED)

PART 97--AMATEUR RADIO SERVICE--Table of Contents

Subpart A--General Provisions

Sec. 97.9 Operator license grant.

(a) The classes of amateur operator license grants are: Novice, Technician, Technician Plus (until such licenses expire, a Technical Class license granted before February 14, 1991, is considered a Technician Plus Class license), General, Advanced, and Amateur Extra. The person named in the operator license grant is authorized to be the control operator of an amateur station with the privileges authorized to the operator class specified on the license grant.
(b) The person named in an operator license grant of Novice, Technician, Technician Plus, General or Advanced Class, who has properly

submitted to the administering VEs a FCC Form 605 document requesting examination for an operator license grant of a higher class, and who holds a CSCE indicating that the person has completed the necessary examinations within the previous 365 days, is authorized to exercise the rights and privileges of the higher operator class until final disposition of the application or until 365 days following the passing of the examination, whichever comes first.

> FCC decided not to go with the majority, that's all.

Two points:
(1) Those that actually file ocomments are NOT
the only individuals that count, so any "majority" so determined
by only counting opinions in comments is of no real value.
(2) If I recall, the "majority" so determined was opposed
to any test other than 5 wpm to satisfy the treaty.

>
> Of course hams fought it tooth and nail and eventually the FCC dropped
> the idea, and instead expanded 27 MHz CB to 40 channels.

The relavence of that is?
Seems to me that not too long ago the FCC did take
part of 220 even though the overwhelming majority
of amateur commentors were opposed.

> One wonders what would have happened if hams had taken a different tack,
such
> as "OK, take 220 but give us back 11 meters" or some such.

Illogical. To do that, the FCC would have had to make
illegal all those 23 channel CBs that had already been sold.

Cheers,
Bill K2UNK

No, Kim is correct. The CSCE is only good for upgrading for 365 days (not 1 year, btw - watch out for leap years!) The holder of a CSCE must use it to upgrade before it expires or it is useless for upgrading.

It's an oddity of the restructuring. A Tech with a CSCE for Element 1 (code test)
has Novice/Tech Plus operating privieges for as long as the license is held, but
loses upgrade credit when the CSCE expires. Yes, it's a contradiction to give HF
privs (which, by the FCC's own rules, indicates successful code testing) but to deny code test credit, but them's the rules. I think the idea is that the FCC wants
to encourage Tech Pluses to upgrade to General or Extra, but at the same time doesn't want to take operating privs away.

Anybody with a pre-restructuring Tech Plus doesn;t have to retest for code, though.

Here's another odd one: If a person can show that they ever held a Novice class license, they get Element 1 credit. Doesn't matter how long ago the Novice license expired, or whether other license were held. But ONLY the Novice gets this credit! Go figure.

Use your CSCE before 365 days or you'll have to take the element over again.

Jim:

I'll tell you what would have happened. We would have lost a little-used and essentially redundant VHF band, and a lot of pressure would have been taken off of the ARS for low-code/no-code licensing. The short-sightedness and selfishness of spectrum-hogging hams is what put us in this mess, when a very acceptable and virtually painless solution was readily to hand. Can you say FUBAR?

Cecil:

Don't look now, but neither does PACTOR, PACTOR II, PSK-31, MFSK-16,
or any other digital mode. However, I've communicated via direct-wave
propagation a lot farther using CW on a "dead" band than I have with any
of the above mentioned modes, but hardly at all with SSB, AM, or FM.

>CW does NOT have supernatural powers.

Only God has supernatural powers, Cecil -- but here, we're talking about
modes of radio communication.

>CW is, however, one of the best QRP modes.

Glad to see you acknowledge this fact. However, with the reduction
and eventual elimination of code testing, far fewer hams will be using
CW on QRP, or at any other power level.

>Yup - but the FCC doesn't care about that. They have other fish to fry.

Well, "frying" those fish is Riley Hollingsworth's job, but maintaining
licensing standards could have made his job much easier, IMHO.

>Consider the medical waiver thing. FCC has to handle all of those because who
>got a medical waiver is NOT in the public database. FCC just wanted out of
>it.

The medical waiver fiasco is an atrocity inflicted upon us by the improper
wielding of political influence by the late JY1, and the complicity of
former President Bush's State Department. It began with the whining of
another codeless ham who, if the truth be told, should have simply been
politely informed by JY1 that this was not an appropriate matter for him
to address through diplomatic channels. The entire thing was badly
botched on all three sides -- again, IMHO. It's just too bad that someone
at the FCC couldn't see the problems a "medical waiver" would cause
for them, from an administrative point-of-view, and send the proposal
back to the State Department with that very point driven home in the
clearest terms. The whole thing was just an exercise in political
ass-kissing all around, to the discredit of all involved. And that's not
just IMHO, that's a natural fact.

>>>Note that FISTS and the ARRL
>>>did encourage all to express their opinions direct to the FCC.
>>
>>Well, that was mighty nice of them to encourage us to do something
>>we all had the right to do anyway.
>
>But did we do it? I know you did (very well, I might add) and so did I, but
>where was everyone else?

Your acknowledgement is very kind, considering the quality of your own
comments to the FCC. As to everyone else, I think that what we've seen
is the total disbelief in the title of the FISTS organization, "The
International Morse Preservation Society." If more FISTS members took
that high-sounding title to heart, perhaps they would have sent in
enough comments to make a difference. However, that didn't happen.
Now, we're stuck with the result -- which will inevitably a conversion
of CW bandwidth to phone usage.

>>>FCC has been pushing for the end of code testing since 1975.
>>
>>And it seems as though they'll soon get their wish. However, as a

>
>Doing so would have opened up a whole can of worms best avoided.

I really don't see how bad opening that particular can of worms could
have been, but we'll never know. All we have to look forward to now
is the "refarming" of the Novice/Tech+ CW subbands, and probably
a good bit of the General-and-above CW subbands, to use by the
mic jockeys.

Amateur Radio Newsline Report 1278 – February 8, 2002

Amateur Radio Newsline report number 1278 with a release date of Friday, February 8th, 2002 to follow in 5-4-3-2-1.

The following is a Q-S-T.

Another Anthrax scare halts mail to the FCC in D.C. and ham radio growth may not be as good as it seemed. These stories are first on Amateur Radio Newsline report number 1278 coming your way right now.

(Billboard Cart Here)

**

AMERICA AT WAR: FCC STOPS D.C.MAIL DELIVERY DUE TO NEW ANTHRAX SCARE

The Federal Communications Commission says that it will not accept paper mail in the Washington D.C. area until further notice. This, after a trace amount of the Anthrax virus was found during a routine test. Amateur Radio Newsline’s Paul Courson, WA3VJB, is in the nations capitol with the details
--

The scant amount of anthrax contamination found at a Federal Communications Commission mail facility in Maryland last week was consistent with cross-contamination of mail. At least that’s what the result of tests conducted by the Center for Disease Control and Prevention showed.

The FCC's mail processing facility in Capitol Heights Maryland, outside Washington, was tested about a week and a half ago as a routine precaution. One sample taken tested positive for Anthrax. The C-D-C blames the problem on cross contamination of mail. This means one or more pieces of mail from another facility may have inadvertently brought the contaminant to the Maryland site.

The agency is arranging for the facility to be decontaminated and re-tested. Mail deliveries, which have been halted, will not resume until the area is found to be anthrax-free. For ham radio, this only affects such things as requesting or commenting on rules change requests.

The FCC said it would also test the mail room at its Gettysburg, Pennsylvania, facility to make sure that it is Anthrax free. Gettysburg is where most Amateur Radio related mail including license applications and renewals are sent and is not affected by this latest paper mail suspension order. At least not so far.

For the Amateur Radio Newsline, I’m Paul Courson WA3VJB in Washington.

--

Late last year five people, including two postal workers, died of the inhalation form of anthrax and more than a dozen were infected in a series of attacks that followed the terrorist raids on the World Trade Center and the Pentagon. So far no arrests have been made in that case. (Published news reports)

**

SPACE AND SCIENCE: ON-ORBIT COMPUTER FAILURE CAUSES ISS OUTAGE

Ham radio was there but it was not needed. That’s the basic wrap up after a computer failure aboard the International Space Station sent the 17-story complex into a slow drift for a few hours on Monday February 4th.

The temporary outage also disrupted voice communications with the ground using normal channels. It also brought science research to a halt. But NASA officials said that neither the station nor its crew ever were in any danger.

The station drift was halted about 17:00 GMT. That enabled the crew to begin the job of re-orienting the stations solar panel arrays. Once normal power levels were restored, systems and experiments that had been shut down were brought back on line.

The computer shutdown was eventually traced to a defective hard drive. James Hartsfield, a spokesman for NASA's Johnson Space Center in Houston said that the three ham crew was never in any danger as a result of the failure. He termed it nothing more than an interruption to their normal work day.

Launched last December 5th on board the shuttle Endevour, Russian cosmonaut Yuri Onufrienko RK3DUO and U.S. astronauts Daniel Bursch KD5PNU and Carl Walz KC5TIE are the forth crew to inhabit the I-S-S. In addition to all of the high tech communications gear the crew also has ARISS - the ham radio station on board the International Space Station as backup voice and data communications. It was available, albeit not needed this time around. (ARNewsline(tm) from NASA Release)

**

HAM RADIO GROWTH: CENSUS REDUX

Some dark news following the good news on ham radio growth patterns. The numbers may not be as good as we reported two weeks ago. So says Fred Maia, W5YI, who follows growth trends in ham radio. And Fred says that the numbers we presented are overly optimistic:

--
Fred Maia:

“The FCC database is a database of all amateurs who have been licensed for twelve years. Thats ten years for the license term and an additional two. The reason it stays in the database for the additional two is so that it can be renewed diring the grace period. Thefefore, the licenses in the database are two years more thanthe ten year term or twenty percent inflated.”

--

In our story we used statistics from several sources including QRZ, W5YI and others. But Fred says that there are more recent numbers that show things may not be as good as they may seem on the surface.

According to Fred, as of January 15th 2002 there are actually only 98,030 holders of the Extra class license, 86,425 legacy Advanced, 138,546 Generals, 318,603 Technicians and legacy Tech plus and only 39,972 Novice class. The total is 681,576. That is considerably lower than the 720,194 in the latest QRZ census and 10,424 lower than the adjusted 692,000 we believed to be accurate.

The bottom line. Once you take away the expired licenses that are in their grace renewal period, the club and military recreation stations and the like the numbers tell a different story. One thats not nearly as rosy as we and others thought only two weeks ago. (ARNewsline(tm))

**

WINTER OLYMPICS 2002: COMMEMORATIVE STATION ON THE AIR

The Winter Olympics are in Salt Lake City Utah and ham radio is helping to celebrate the games with a special events station. Linda Reader, N7HVF, has more:

--
“Its going to start on Thursday at 5 PM Mountain Standard Time and it will go until the 25th of February. It will be available on all bands, so people will only need to listen around. The station call will be W7U and the trustee is W7EO.”
--

Again, listen for W7U celebrating the 2002 Winter Olympics through February, 25th. (N7HVF)

SPECTRUM: WHITE HOUSE PROPOSES PAYOUT TO CHANGE FREQUENCIES

The Bush administration says that it will propose setting up a $715 million fund to reimburse federal agencies that relocate their RF operations. This, for moving away from spectrum that has already been auctioned to commercial service providers.

In the past, federal agencies have had to negotiate with the winning bidders to cover relocation costs. In fact, following the September 11th terror attacks the Pentagon said it would not move off bands that it uses for military training and other purposes without sufficient funds to pay for relocating.

This created a stalemate over making available airwaves hotly desired by mobile telephone companies like Verizon Wireless. Now, in his budget just sent to congress, President Bush proposes setting up a fund to streamline the reimbursement process. Auction receipts to cover agency's relocation costs would be paid into the fund and federal agencies would be reimbursed for their relocation costs out of the proceeds.

What does this mean for Amateur Radio you ask? Simply that more spectrum that hams share with the government and military could be up for grabs sooner than most thought it might happen. But even with the subsidy some analysts of military communications say that it still could take several years before you see any spectrum moves take place. (Published reports)

**

FCC: OLYMPICS CAN USE 2300 MHZ HAM BAND FOR OLYMPICS

Broadcasters at the 2002 Winter Olympics have been granted a Special Temporary Authority from the FCC to use a ham band for their coverage of the Salt Lake City games. The S-T-A was made available at the request of the Salt Lake Organizing Committee R-F coordination group to use 2300 to 2305 and 2390 through 2450 MHz for remote pick-ups at various Olympic venues.

Unlike Australia two years ago, this FCC action does not take hams off the air nor does it forbid amateur use of the band during the period of the S-T-A. Instead it took action reminiscent of one that helped to establish ham radio’s “National Frequency Coordination Council.” The agency told all spectrum users that it had designated the Salt Lake Organizing Committee is the single point of contact or “SPOC” in regard to all Olympics radio frequency requirements. This delegated authority continues with the committee through March 31st. (FCC, Broadcasting & Cable, ARNewsline(tm))

**

PUBLIC SERVICE: HAM RADIO AT THE SUPERBOWL

Last week’s Super Bowl played in New Orleans between the St. Louis Rams and the New England Patriots was a squeaker to the very last play. With the game tied at 17 to 17, in the 4th quarter, New England opted for a Field Goal that brought them victory in the very last seconds of normal play. It was a game seen by millions, but what t-v viewers did not see was the work of a group of New Orleans area hams who were a part of the behind the scenes communications effort for the game. Amateur Radio Newsline’s Don Wilbanks, KC5MFA, lives in the Big Easy and has this look at the role that ham radio played:

--
While thousands cheered on the Rams and Patriots inside the Superdome and millions watched on television around the world, a handful of New Orleans hams were busy outside in the streets of the Crescent City.

--
“K5OEP go ahead.” “Checking in, nothing to report. Everything’s normal. WA5RT 2104 aaah, Poydras and South Claiborne.” “K5OEP roger, 2218. Other station?”
--

K5OEP is the call sign of Southeast Louisiana ARES. New Orleans area hams assisted the American Red Cross as they provided tracking for those sent to area shelters or hospitals should the unthinkable occur. Several Emergency Response Vehicles were in use feeding the workers and standing by in reserve should they be needed in an emergency. The ERV’s had a staff of 2 plus a ham with voice capability and APRS tracking. There were “Action Teams” standing by with a ham and a dual band HT. Hams also manned a command post trailer at City Hall as well as the Red Cross operations center on Canal Street and another Red Cross office in suburban Metairie. The communications operations began on Friday, February 1st and continued Saturday as well as Super Bowl Sunday. Tom Miller, AC5TM, ARRL Louisiana Section Emergency Coordinator and Keith Barnes, W5KB of the Red Cross were instrumental in putting the effort together. The local CBS affiliate, WWL-TV channel 4 did a lengthy report on the Red Cross, of which about a minute was focused on the hams. Several hams were featured on camera in the piece. Thankfully, this is representative of most of the radio traffic.
--
“K5OEP this is W5GAD.” “W5GAD, K5OEP go ahead.” “Just checking in Josh and, um, if it’s possible could we get a cup of coffee next time the truck comes down this direction?” “This is KC5BCR, we’re gonna take care of that coffee request.”
--

Only three things occurred that could be considered out of the ordinary... a semi-nude escapee jumped off a bridge to evade capture, a Rolodex in the Superdome caught fire from being too close to a light and the New England Patriots finally won the big game. And isn't it fitting that an underdog team called the Patriots would be victorious on this first Superbowl since September 11th. Next on the agenda for the city... Mardi Gras on Tuesday, February 12th. From Party Central in New Orleans, Louisiana, I'm Don Wilbanks, KC5MFA.

--

Before we leave this one we have some interesting statistics. According to the Broadcasting and Cable newsletter, Super Bowl 36 delivered the Fox Television Network a 42.5 rating and 61 share in what are called the metered Nielson overnight market ratings. This means that about 67 percent of United States households with television sets had them tuned to the game at some point during the telecast. (ARNewsline(tm) - Produced by KC5MFA with sound provided by KD5BLV)

RESCUE RADIO: HAMS ASSIST FOLLOWING QUAKE IN TURKEY

Amateur Radio operators in Turkey were among the first to respond in the wake of a earthquake that rocked the province of Afyon on Sunday February 3rd. More than forty were killed and at least 170 were injured injuries were reported in

the aftermath of the 6 point zero tembler. Structures were destroyed and lines of communications were cut. Enter Amateur Radio.

According to an ARRL bulletin members of Turkey's Civil Defense Search and Rescue Team responded following the quake. The bulletin quotes Aziz Sasa, TA1E, the president of the Turkish national Amateur Radio society as saying that S-A-R communicated with it's headquarters in Ankara and within the affected area. This was because ham radio was the only long and medium-range communication resource available until normal lines of communications were restored. Most ham radio communications was on VHF using a system of linked repeaters. (ARRL)

**

RESCUE RADIO: AMATEUR RADIO OPERATORS HELP SAILBOAT IN DISTRESS

The ARRL Letter says that Amateur Radio played a role in the rescue of two people aboard the sailing vessel Antigone. This, after it ran aground off Honduras on Thursday, January 24th.

Ed Petzolt, K1LNC, of Hobe Sound, Florida, told the Letter that, despite some apparently deliberate interference, members of the Intercontinental Net on 14.300 MHz helped relay communications from the vessel, which was equipped with an High Frequency marine radio.

David Walz, AG4LI/HR6, in Honduras was in contact with the boat and passed traffic from the stranded mariners to the Net. Petzolt said he was able to patch the US Coast Guard in Miami through to Walz, so the Coast Guard could obtain additional information and coordinate with Honduran authorities.

Petzolt said the two passengers aboard the 40-foot vessel were safe, and the boat was on the beach. The FCC is reportedly investigating the interference issue. (ARRL)

**

HAM RADIO SCHOLARSHIPS: QUARTER CENTURY WIRELESS ASSOCIATION

The Quarter Century Wireless Association has announced its funding several scholarship for 2002. There are eleven QCWA scholarships valued at $1000 each and five valued at $1500 each to be awarded later this year. Hams interested in applying for the QCWA Scholarships should contact the Foundation for Amateur Radio. The Foundation administers the scholarships sponsored by the QCWA. Additional information and an application form may be requested by letter or QSL card to the FAR Scholarships, Post Office Box 831, Riverdale, Maryland, 20738. (QCWA)

**

HAMFESTS: LIMARC N.Y. FEBRUARY 24TH

LIMARC -- New York's Long Island Mobile Amateur Radio Club will hold its annual indoor Ham Radio flea-market On Sunday, February 24th. Location is the Levittown Hall beginning at 9 a-m. More information is on the web

www.limarc.org. (N2DO)

**

THE HANDI-HAMS: 2002 CALIFORNIA CAMP FULL

The Minnesota based Handi Hams say that their California Radio camp is now full. This year, campers will be treated to presentations by Jeff Reinhardt, AA6JR, for Alinco, and everybodys favorite ham radio instructor Gordon West, WB6NOA. The dates for the 2002 Handi Ham California Camp are March 3rd to the 10th at Camp Joan Mier in Malibu. More is in cyberspace at www.mtn.org/handiham/workshop.html. (HandiHams)

EMERGING TECHNOLOGY: SUPER NET HAS ARRIVED

Australia’s new super-net has had its first successful demonstration, proving it can carry an enormous amount of data between two locations. In fact, its not just fast. It is virtual reality come to life. Q-News Graham Kemp, VK4BB, has a look at what super net can do:

--
In its 'maiden voyage,' the new high speed networking technology --10 Gigabit per second Ethernet -- ran a revolutionary combination of technology that allowed two people, in different locations, to work together on a virtual 3D object, each being able to feel the object and see what the other person was doing to it. At the same time they could use a studio quality video link to communicate.

These two functions were tested in a situation where they had to compete against a volume of network traffic equivalent to Sydney's telephone system at peak levels.

The demonstration involved networking a virtual environment from two separate sites, CSIRO's Virtual Environments laboratory at the Australian National University and CSIRO's corporate headquarters several kilometres away.

--

According to Graham, networks such as this will allow users in several locations to feel computer generated objects such as body organs. Among other things, this tactile ability means a surgeon could train many students in different cities at the same time. (Q-News)

**

EMERGING TECHNOLOGY: CENTRAL STATES VHF SOCIETY CALL FOR PAPERS

The Central States VHF Society will be holding it's 36th Annual Conference later this year. The dates are July 26th to the 28th at the Sheraton Four Points Hotel in Milwaukee, Wisconsin.

And now comes an invitation to those interested in making presentations at this event. You are invited to submit an outline to Marc Holdwick, N8KWX, who is this years Technical Program Cairman.

Holdwick says that any topic related to weak-signal VHF operation is welcome and can be submitted in either paper or electronic format. But says N8KWX, those submitting will be required to have the finished work in his hands by May 5th to be included in the printed Proceedings.

If you are interested in taking part, you can contact Mark Holdwick by e-mail n8kwx@csvhfs.org. His snail-mail address is PO Box 6051, Buffalo Grove, Illinois, 60089. More information is on the web at www.csvhfs.org/CSVHF02.HTML (CSVHFS)

**

EMERGING TECHNOLOGY: RF CONTROL OF BIOMOLICULES

Scientists from the Massachusetts Institute of Technology Media Lab report that they can now control biomolecules with radio frequency energy. Bruce Tennant, K6PZW, reports:

--
Biomolecules such as proteins and nucleic acids are basic building blocks in nature. They carry out a wide variety of nano-scale functions, many of which have proven useful in drug discovery, drug delivery, biocatalysis, and bio-materials. But to optimally exploit these capabilities, researchers must be able to rapidly control their activity.

Now in the paper, titled "Remote Electronic Control of D-N-A Hybridization Through Inductive Coupling to an Attached Metal Nanocrystal Antenna, researchers describe a unique method to do this. One that employs the phenomenon of inductive coupling to metallic nanoparticles by radio frequency energy to specifically and remotely control DNA molecules. And they say, it works.

For the Amateur Radio Newsline, I’m Bruce Tennant, K6PZW.

--

Their paper was published in the January 10th issue of the journal Nature. More information is available at www.engeneos.com. (Technology Today)

**

INTERNATIONAL - UK: NEW RSGB PRESIDENT

The Radio Society of Great Britain has a new President. As of January 1st, Bob Whelan, G3PJT, has taken up the leadership position at the United Kingdom’s national ham radio society.

Whelan says that he is looking forward to the challenges ahead in raising the awareness of the value of Amateur Radio as a way of interesting the next generation of radio engineers and scientists. He will serve a two year term leading the RSGB. (GB2RS)

**

INTERNATIONAL – SOUTH AFRICA: NEW SHORTWAVE GUIDE

Media Network reports that a new comprehensive country-by-country guide to domestic and external shortwave broadcasts from sub-Saharan Africa, including opposition broadcasts to the African continent, has been added to the British DX Club web site. The guide, compiled by BDXC editor Tony Rogers and fully updated for the winter schedule period, is available in by-country and by-frequency versions. It can be found on the Articles index page of the web site at www.bdxc.org.uk. (Media Network)

**

CONTESTS: GREAT LAKES QSO PARTY

The Great Lakes QSO Party will begin on Saturday, March 9th at 17:00 UTC and run through Sunday March 10th at 04:00 UTC. The object of this contest is to work as many Great Lakes States as well as VE3 and VE4 Canadian provinces as possible during the allotted time. C-W and SSB are the only modes permitted and operation is on all bands except for WARC. Logs must be submitted by mail before April 25th to the address listed at the contest website. Look for more information at www.geocities.com/mdxa1/qsoparty.html. (E-mail)

**

DX

In DX, the Trindade 2002 PWØT team reports that several major sponsors have come forward providing vital support for the upcoming DXpedition. ICOM America will be providing a number of ICOM IC-756 PRO II transceivers. ICOM will also be sending along an IC-910H for satellite operation. Possibly the first-ever satellite activity from Trindade.

But that’s not all. Electril, a Brazilian manufacturer, has begun shipping antennas to the team staging area and Bob Heil, K9EID, of Heil Sound has personally made arrangements to insure that the DX’ers will have new reliable headsets. Meantime, JA1FGI and JA1WSK have covered the cost of purchasing and shipping a complete RTTY, PSK-31 and SSTV equipment package. Lastly, its reported that the Six Meter Amateur Radio Klub and the Chiltern DX Club are the first organizations to provide the D-Xpedition with financial support.

The operators will leave Rio de Janero on February 15th for Trindade. More information is at the DXpedition website located in cyberspace at www.trindade2002.com (PW0T release)

**

THAT FINAL ITEM: THE SWOOPER

And finally this week, a loud buzzing noise being heard in the international shortwave band is apparently a new RADAR system used to measure wave height. According to Mark Fine, the system is located at Barnegat Bay New Jersey and transmits a one megahertz wide signal in varying five megahertz wide segments. Take a listen:

---
swooper audio here
--

Fine tells Amateur Radio Newsline that he made that recording on 4.795 MHz at 1850 UTC on February 5th. He was listening on a Drake R 8 A receiver set to upper sideband and a 2.3 kHz bandwidth. He says that during the evenings this beast takes over a whole band and is heard as far away as Europe and South America.

Already, some SWL’s have nick-named the noise a "swooper" because it sweeps quite fast making a "swoop" noise as it goes by in SSB. Others have called it the Windshield Wiper Network, which they say is very apropos. (DXLD, CGC Communicator with “Swooper” audio provided by Mark Fine).

**

NEWSCAST CLOSE

Well, IIRC, 220 is open to Novices...maybe we just need more Novices
:)

>145.190 is my "home" on 2M. I've been with Billy's machine nearly since
>becoming a ham. You'll never hear anyone tell you what you can/can't talk
>about on that repeater. If they do, they ain't been there very long! It's
>an excellent machine with excellent range.

I've hit it solid from 95mi out with a mobile dualband, so it's pretty
good when it's cooperating. I guess they've got the problems worked
out now, though, since we haven't had the vile cracklings all over the
late traffic net lately. 2m FM just shouldn't sound like 160m QRP AM
during a thunderstorm.

>Same here. Most of my 2M operation here in the last six months or so has
>been on rare occasions when my husband and I are traveling to meet for
>dinner and then on the way home. We'll used simplex.

Well, I'm still pretty active on the late traffic net, but for the
most part, I'm either listening to the IRLP node, or just playing
memory channel roulette.

>Speaking of 10M, I went out today to visit with my parents. Mom and I had
>gotten my dad a Radio Shack 10M rig for Christmas and he is blind, so could
>not figure out all the buttons, etc. I sat down with him and taught him all
>the buttons, gave him some pointers on SSB operation and suddenly heard a
>Icelandic station on 28.360!!!! TH____ (forget now).

Propagation has been interesting lately. I was playing with an 11m HT
(mostly pondering the potential uses of its innards, since it was on
closeout at RS right next to the 49MHz radio I'm planning to move to
6m) and was hearing quite a lot from a normally lousy spot, on
something that should be about as insensitive as a pile of rocks.

>WOW, I couldn't
>believe it. I have heard 10M lately and couldn't believe I was hearing
>Iceland. I got to show my dad the example of longpath (didn't work)
>propagation vs. direct/short. He is a retired Chief Radioman in the Navy,

No, she isn't incorrect. The code element granted via a CSCE is good forever with regard to operating privileges, but only valid for 365 days for upgrade purposes (to general or extra, currently). If one does not UPGRADE within 365 days to general (or extra), one loses the code credit and must retake element 1. However, one can continue to operate on the "novice HF bands" even if the retaken element is failed!

Jim Kelley wrote:

> Thanks for your reply Dick. But don't you think you could have made your
> point without perpetuating the enmity between hams here?

Sure, Jim, we could all do that, couldn't we? So why is it that all the "other side" of the "discussion" get almost wholly ignored while they stir and stir and stir, and we, namely Larry and me, get trashed by not only the knaves but the good guys too? What is it about being a pugnacions louts like Carl and Cecil that get them a pass for all the damaging assertions, accusations and downright lies, while mainstreamers like you turn the heat on those of us who defend ourselves? Do you really think I like to feel I have no choice but to respond in kind, maybe with a little twist to the blade? I'll say it again- I showed up here a few years ahead of you with a helpful attitude, and what happened immediatly, almost instantly, dismayed me, sae me back on my heels in disbelief. And these characters seem to hold some sort of hammer over many of you middle-roaders, ARRL and even the FCC. It's nothing short of amazing!

If we could

> separate the lambasting (on both sides) from the issues, I think we'd
> actually see more agreement in goals.

I don't doubt that at all. So why don't we see someone taking Stevenson and Moore to task in kind, perhaps with an eye to a little more civility and less rancor? We all know the code test is a done deal, awaiting the calendar, for whatever time that may take. That changes nothing about the FACT that radiotelegraphy remains one of the most universal tools a ham has available, if only he is intelligent enough to use it. Maybe that fact is what sticks in Stevenson's craw
and causes him so much reflux. If so, there's a simple solution to it all- he can merely recognize and admit that it is fact, and stop his belligerance toward CW and everyone who is able to use it, just as we have certainly adknowledged the fact that modern modes HAVE found a and continue to find acceptance within ham radio I'm a very active user), and we can all get on with life. Instead, he slams around like a loose cannon chasing a bull in a china shop, and somewhere along the way, someone is gonna take potshots at him. Ite's inevitable, as long as he keep on that track, and it seems no one can do a derail job on him.

> What kind of response do you expect
> to receive to your ideas when you expend so much verbiage calling people
> names?

I'll say it one more time- I turned the other cheek and it got whacked right off, and I'm tired of it. Don't to that anymore.

> You discredit your own point of view. You negate the validity of
> the point of your argument. If you want to shoot down someones argument, do
> that.

You find a way to call off the dogs, and I'll be pleased to stop stomping 'em.

> But calling them names doesn't work. It's not a valid
> counterargument. Who wants to listen to an angry namecaller?I don't know what
> you hope to accomplish by talking about "tired refrains from techies". What
> do you call the guys who have always experimented with radio? Weren't the
> guys who developed SSB and RTTY the 'techies' of their era?

I think you misread the term as it was not intended to be derogatory, rather as
an abbreviation. Even the geeks of today call themselves geeks. It's language in
transition. I used 'techies' to keep from having to use half a sentence to
otherwise describe them. Do you think Doug Smith considers himself a techie> I
have no doubt he does, and from all accounts he's all that Stevenson and Moore
are not, a really nice fellow.

>
> Cecil and Carl know they can say anything they want to you, Dick, because
> they know you don't argue effectively or rationally against them.

So when they feel like being called assholes, all they gotta do
is provoke me, right? So what they claim is so much vapor designed
solely to make me angry? So why aren't they being called to task for it?

> I think
> you can, but as often as not, you dilute it with a bunch of namecalling.

Reality doesn't seem to mean much to them. When it comes to actually
DOING ham radio with digital modes, I KNOW I've exceeded the
both of them by a fair margin. Maybe that's their problem -Their
rantings are from a position of theory and talking, for the most part,
and not that much on-air HF time. Cecil says he loves CW, and maybe
he does. Sometimes love doesn't amount to much to some folks. As for Carl,
he wouldn't be caught with a J-38 on his premises.
So Stevenson designs cordless telephones. Magnificant. As far as
I can determine, the both of them are full of hot air or worse.

>
> Try editing out all the personal stuff before you send. You might find
> you'll see less of it in their replies to you.

Yep, just let the slams come on long enough and I imagine they will
eventually believe their own nonsense. And who knows about all the
bewildered newcomers? THEY are the main reason for all this, you
know. Cecil does.

> On the other hand, maybe
> that's what floats your boat. I don't know.
>

Don't own a boat, Jim. I guess I'm getting a bit on the intolerant side
in my old age. I just don't suffer fools and jackasses near so easily as

I once did, even those who claim to be geniuses.

>
> Best 73, and I look forward to the next RRAP CW net.

Got it.

4111. Re: Cell Phone: Are they Safe? - My Research

>I'm a graduate student at UConn, and I've done some research on the
>safety of cell phones. You can view my article at
>http://members.aol.com/cellphoneemf/. I'd love to get feedback.
>Thanks.

Interesting work. I scanned it briefly, and did note a few details that missed the mark.

For example:

"The animal studies also cast doubt on the safety of cellular phones and other low-level radiation sources. It is confusing as to why the Toler study(20) chose to expose the mice to 435 MHz as opposed to 2450 MHz since it duplicated the Chou (21) experiment in every other aspect."

On what basis did you feel the choice of frequency "cast doubt?" If one wants to do an animal study that has a reasonable relationship with possible human effects, one would choose a frequency that is not close to the resonant frequency of the animal. Your "cast doubt" conclusion missed the mark.

Other choices of words, IMHO, show that there is a significant bias to the study and its conclusions. I am sure your research found that groups like the World Health Organization, Committee for Man and Radiation, etc., have made statements that is no substantive evidence that exposure to RF at the levels of the current standards pose a known human health risk. They then go on to discuss the unknowns, the ongoing studies and the need for same. Translating that to "grave concern" is, IMHO, not accurate and shows bias.

Just a very fast take.

>Moore's attitude, if not the FCC's.

Nonsense, again. If the FCC wanted to see very single ham be a digital
designer, they could make a rules change that requires same.

I have ready Stevenson's and Moore's words and did not get the impression that
they want every single ham to be a digital designer.

Let's ask them. Carl and Cecil, do you believe that every single ham should be
a digital designer, or do you believe that Dick has taken the most extreme
possible interpretation of a selected part of the posts you have made?

Same answer.

One could claim that the Novice was not absolute proof of 5 wpm being in
accord with the treaty because of the characteristics of the original Novice
license. The same cannot be said of the Tech license.

Larry:

That's one possibility. As I recall, though, many cb users were also against
it,
because:

- much less dx potential on 220
- have to buy all new rigs and antennas
- existing equipment would be almost worthless

I doubt it would have eased the pressure on license tests, though.

Yeah, I suppose it's inevitable, but I for one will not appreciate an electronic QSL as much as I do the old-style postcard kind. I like seeing the pictures chosen by the DX, I like it when I get a card with a hand-written message on it (yeah, that's pretty rare) and I like getting stamps from the DX country on their envelope.

Sure, lots of people now just print out a stick-on label for their card. Lots of people just use those generic callsign-and-qso-info cards. Lots of cards don't come with exotic stamps, since they arrived via the manager, or were metered instead of stamped. Still, I come home every day and the first thing I do is check the mailbox for QSL cards. The electronic ones just won't have the same thrill.

One man's lie is another man's truth, Dick. Gentlemen can disagree without
being disagreeable. I treat you the way you treat me.

> That changes nothing about the FACT that
> radiotelegraphy remains one of the most universal tools a ham has available, if
> only he is intelligent enough to use it.

Not "intelligent", Dick, rather "skillful". The great majority of the most
intelligent people in the world do not know Morse code. The FCC says that
Morse code skill is uncorrelated to intelligence. Skills may be useful
but are hard to learn for many people. Can you dunk a basketball?

> So when they feel like being called assholes, all they gotta do

If you allow yourself to be provoked to anger, what you have to say
while you are angry is irrelevant. Therefore, anyone who can provoke
you to anger wins the argument by default.

> I KNOW I've exceeded the both of them by a fair margin.

Oh, you have a DSP eval board with which you do DSP experimentation?
What board is it, Dick. Maybe we can exchange some software.

Speaking for me, I would like to see as many present day hams experimenting
with digital modes as there were hams experimenting with SSB in the early
1950's. There's almost no hardware design expertise necessary to buy a DSP
eval board and get to experimenting.

I'm not talking about non-dead bands, Dick. "CW gets through when no
other mode will" is simply a false statement. No mode gets through
"when the band is absolutely dead".

There is a window when CW gets through and SSB fails. On one side
of that window, both SSB and CW get through. On the other side
of that window, neither SSB nor CW get through.

AND nobody has said that any of those modes "gets through when
no other mode will", which of course, would be a lie just as "CW
gets through when no other mode will" is a lie.

You still just don't get it, Larry. Nobody, including me, can prove that
he/she is not a criminal. That's why we have the "innocent until proven
guilty" concept in this country. The Salem "witches" were asked to prove
that they were not witches. They couldn't so they died. You and I also
cannot prove that we are not witches.

2001 Darwin Award Winners

Remember all the stories below are true!

THESE FOLKS ARE NOT THE SHARPEST TOOLS IN THE SHED

1.WILL THE REAL DUMMY PLEASE STAND UP?
AT&T FIRED President John Walter after nine months, saying he lacked intellectual leadership." He received a $26 million severance package. Perhaps it's not Walter who's lacking intelligence.

2. WITH A LITTLE HELP FROM OUR FRIENDS:
Police in Oakland, California spent two hours attempting to subdue a Gunman who had barricaded himself inside his home. After firing ten tear gas canisters, officers discovered that the man was standing beside them in the police line, shouting, "Please come out and give yourself up."

3.WHAT WAS PLAN B???
An Illinois man, pretending to have a gun, kidnapped a motorist and forced him to drive to two different automated teller machines, wherein the kidnapper proceeded to withdraw money From his own bank accounts.

4. THE GETAWAY!
A man walked into a Topeka, Kansas Kwik Stop, and asked for all the money in the cash drawer. Apparently, the take was too small, so he tied up the store clerk and worked the counter himself for three hours until police showed up and grabbed him.

5. DID I SAY THAT???
Police in Los Angeles had good luck with a robbery suspect who just couldn't control himself during a line-up. When detectives asked each man in the line-up to repeat the words, "Give me all your money or I'll shoot," the man shouted, "That's not what I said!"

6. ARE WE COMMUNICATING??
A man spoke frantically into the phone, "My wife is pregnant and her contractions are only two minutes apart!" "Is this her first child?" the doctor asked. "No!" the man shouted, "This is her husband!"

7. NOT THE SHARPEST TOOL IN THE SHED!!
In Modesto California, a man tried to hold up a Bank of America branch without a weapon. He used a thumb and a finger to simulate a gun, but unfortunately, he failed to keep his hand in his pocket.(hellllllooooooo!)

8. THE GRAND FINALE
Last summer, down on Lake Isabella, located in the high desert, an hour east of Bakersfield, California, some folks, new to boating, were having a problem. No

matter how hard they tried, they couldn't get their brand new 22ft Bay liner to perform. It wouldn't get on a plane at all, and it was very sluggish in almost every maneuver, no matter how much power was applied. After about an hour of trying to make it go, they putted to a nearby marina, thinking someone there could tell them what was wrong. A thorough topside check revealed everything in perfect working condition. The engine ran fine, the out drive went up and down, and the prop was the
correct size and pitch. So, one of the marina guys jumped in the water to check underneath. He came up choking on water, he was laughing so hard.NOW REMEMBER THIS IS TRUE....
Under the boat, still strapped securely in place, was the trailer.....

Hey, it is still kicking. They did not dump it in the ocean
after all. The ARRL really fouled up a golden opportunity.
They could have bought when it was on the chopping block at
pennies on the dollar and had the robust worldwide
communication system that the membership wants.

73,

> eval board and get to experimenting.

Well, there you have it. You don't even know what you're saying.
Your "experimenting" is all done with digital theory and writing software, forget actually putting a rig on the air (save for your 'favorite' mode, CW). Mine is USING digital modes on the air to compare and see what each will actually do in various condions.
Probably the clearest demonstration of our differences goes back the flap over PSK31 where I could copy the CWID but not the PSK on that group of weaksignal Europeans on a near-dead 20 meter band.
You said one must compare modes in a 31 hz bandpass and I said nonsense, in an operational situation you compare under the conditions you use. Theory vs practice. Digital engineering vs ham radio on the air.

So what in the world makes you think the ARS would "benefit" from every ham designing his own discrete digital mode? Should we all just talk to ourselves? The software MIXwin contains some 13 digital modes in a single menu, selectable by a click of the mouse.
How many more would you like to add, or more to the point, how much dissipation do we need? No, I don't advocate stopping where we are. I DO advocate that new digital mode development will NOT be enhanced by each novice digidesigner flooding the ARS with his own novice output. After all, we have the likes of Peter Martinez working for us.

Sure, lots of hams who can find LOTS of time and have the aptitude to learn the basics of DSP might benefit marginally from time spent with a evaluation board. LOTS of time. But wait- they didn't have time to learn Morse code, which would take far less than learning DSP.
Looks like you're out of luck Cecil.

BIG difference, Ed. I have actually built a considerable amount of ham gear. On the other hand, how much CW has Carl actually worked? Any at all? Not enough to gain a HF license prior to you know what.

> crude spectrum analyzer he was using WOULD be audible

Ed, have you spent any serious amount of time with the DIGIPAN
display? For sure you can adjust things to show signals you can't hear. It's a
matter of careful adjustment of receiver RF gain more than anything else. At the
point where you drop out virtually all the noise very weak signals show up that
will be masked by just a small amount of ambient band noise. (Signal, and noise,
levels are displayed as brightness levels). Usually the very weak signals are too
weak to lock, in PSK31 mode, but sometimes they surprise you. It's equally good at
evaluating other modes.
The waterfall is really a quite flexible spectral display when you get familiar
it. MIXwin version of Digipan also has a 'oscilloscope' type vertical amplitude
spectral display option (of the receiver's bandpass) which I haven't used that
much, but which also looks interesting.

I really doubt that such weak signals could universally coexist with SS as if SS
was not present. Of course they may not do too well at coexisting with other less
obvious signal presence, ie part 15 and
non-intentional radiators such as computer equipment.

Yep. It's a certainty that not every brainstorm is viable. Even many which prove to be are later radically changed to reflect drastic changes caused by ongoing experience and the realaities of the marketplace. Yes, ham radio IS a marketplace. What can't be sold to hams on a longterm basis won't survive.

I'm not that familiar with pulsars, but assume from the name they "pulse" as this signal did not. It was like it was fast-burst sending message traffic, with a couple repeats, then it was gone.

No, Cecil, intgelligent enough in the first instance to realize that radiotelegraphy IS the most basic radiocommunications mode, and to act accordingly. Insisting on overlooking that basic fact displays a notable lack of intelligence. Or some other more personal Agenda.

> Simple, Jim. Berate them all, call everyone who has been around over 5
>years and
>actually uses CW on the air a dinosaur Luddite. Works every time.

Insufficient. Here are some more reasons to advance your "cause:"

1. Start a website such as "No SSB International" and sarcastically
berate everyone who is the least bit against CW license testing.

2. Constantly imply/accuse/state-outright that NCTAs "hate the code"
and want to "forbid its use." Warn everyone of their "conspiracy."

3. Keep repeating "CW gets through when nothing else will" up to and
including having it engraved on your tombstone.

4. Always repeat to everyone that ANYTHING involving digital
electronics is NOT "real radio." "Real radios" glow in the dark and
are at least 80 pounds in weight, made by true red-white-and-blue
All-American companies. "Always have been, always will."

5. Dismiss every comment about radios and radio theory unfamiliar to
you as "inconsequential" and "having nothing whatsoever to do with
ham radio" unless it was officially published by the ARRL. If it is too
technical (involving more than Ohm's Law) and published in QEX,
dismiss it anyway since it may use some digital device and is not
needed by CW operators.

6. Always denigrate, dismiss, and despise those of "lesser" class than
Extra (heavy) who did not pass a 20 WPM CW test. They are
ignorant, slothful, despicable, dumbed-down because "true"
knowledge, enlightenment, and superiority comes only from God-given
morsemanship.

7. ESPECIALLY denigrate, dismiss, and despise ANYONE not having
passed an amateur radio test because they do not "live up to (your)
high standards set by the 'amateur community.'" Forbid them,

intimidate them, try to suppress their Right to free speech, free assembly and right to petition their government. Remind everyone that ham radio is run-governed-ruled only by hams and no other citizen may comment since they are "undeserving" or "inferior." The First Amendment does not apply to US citizens not possessing a valid amateur radio license.

8. Harass and intimidate all women not in your immediate family group since they are "obviously inferior and not in the true spirit of (all-male or should be) amateur radio." Make any woman a target of abuse if they say anything against your superior viewpoint. Use the most flimsy excuse to show they are a "threat to the ARS."

9. Remember that you and you alone represent the ARS. Whatever personal desires or skills you have are the hallmarks of what is "best" in the ARS. Show all that you are superior because you are.

10. Make fun of experimenters, new modes, new techniques or technology, anything which has not had the "official blessing" of appearing in an ARRL publication. That is a threat to your Way Of Life as only you (as a superior licensed being) can sanction what is "good" for ham radio. Defeat change, destroy the new.

11. Ignore and dismiss anything done in other radio services as having anything to do with amateur radio. Amateur radio is all about "working DX with CW on HF" and anything else not involved with emergencies is obviously inconsequential, of no value, and relates to evil, despicable, criminal CB radio.

12. Remember that you, and you alone, "deserve" special treatment and respect as a tested and credentialed morseman. You are superior in all respects and may freely engage in any behavior you choose while lesser beings must respect, honor, and revere you, always say nice-nice to you under all conditions. You perform a Service to them by simply existing and the world owes you much because of those amateur credentials. You deserve everything you get.

13. Always take Every general comment against your personal viewpoint as specifically made to you, personally. You represent the ARS and what you do is what is good for the ARS, therefore each and every negative against you is against over half a million other licensees. With some practice (and a good ISP) you can go psychotic, split your personality, assume new identities and credentials, harass and stalk others who have opinions against your royal presence. Always seek retribution against those not honoring your supreme psychoses.

The preceding are a few items used by others in this newsgroup. They are offered as a general guide to future newsgroup communications for you in regard to the necessary, obligatory retention of morsemanship in US amateur radio and to show newcomers the joys of becoming a real, live, beeping amateur radio operator-station. Morsemen are superior. Always.

With all kindest regards,
Len

You don't belive the FCC had an ulterior motive in dropping the code test? Do you read? Read what they had to say about the medical waivers. That is proof enough.

What ulterior motive do they have in insisting that hams leap into the digital age? Can you say spectrum auctions? Do they really believe that hams who can be trained in a single day to pass the minimal licensing exam will likely *ever* learn anything serious about radio or digital tecnhology? You may believe it but I don't.

If that was true the best thing they could do is abolish the ARS.
In fact they may eventually do just that. Ask Riley. Better yet, read his
response to Kim. Enough Kims and its all over.

And as you always do when it suits your purplose, you evaded
the point, which was that much of the time the band(s) just SEEMS dead.

I don't know if you noticed, but most of my 'heat' is directed toward them.
Cecil has called me a few names in the past too, Dick. It makes me mad, but
I usually delete them in my response, and try to refrain from responding in
kind.

>Do you really think I like to feel I have no choice but to respond in
> kind, maybe with a little twist to the blade? I'll say it again- I showed
up
> here a few years ahead of you with a helpful attitude, and what happened
> immediatly, almost instantly, dismayed me, sae me back on my heels in
disbelief.

It's about attitude, I think. One thing I always liked about ham radio as a
newcomer was the attitude I encountered on the air. Very positive. I like
that in hams on newsgroups as well. I don't see much of it though. Jim,
N2EY has a pretty good one, I think.

> And these characters seem to hold some sort of hammer over many of you
> middle-roaders, ARRL and even the FCC. It's nothing short of amazing!

Yeah, Rush Limbaugh doesn't like me either. Because I try to consider
opposing viewpoints I guess. He hates when that happens.

> I don't doubt that at all. So why don't we see someone taking Stevenson
and
> Moore to task in kind, perhaps with an eye to a little more civility and
less
> rancor?

You remember back as a school kid how the guy who was always getting razzed
the most was the one who let it get to him the most? Now move to the 21st

century internet newsgroups. The only points Carl and Cecil really score are for logical points. Concentrate on them. If you can't come up with a logical counterpoint, then, maybe they were right? Don't try to argue against arguments that don't have a logical counterargument. That's my best advice.

> We all know the code test is a done deal, awaiting the calendar, for
> whatever time that may take. That changes nothing about the FACT that
> radiotelegraphy remains one of the most universal tools a ham has available, if
> only he is intelligent enough to use it.

Ya know, Dick. I don't see a lot of actual resistance from them to the idea that radiotelegraphy is a useful tool for radio amateurs. I see resistance from them to the idea that it is a cure-all, end-all to radio communications. You gotta know they're right about that.

> If so, there's a simple solution to it all- he
> can merely recognize and admit that it is fact, and stop his belligerance toward
> CW and everyone who is able to use it, just as we have certainly adknowledged
> the fact that modern modes HAVE found a and continue to find acceptance within
> ham radio I'm a very active user), and we can all get on with life.

I don't see it as much as beligerence toward CW as it is beligerence toward you, Dick. What that means is you guys aren't arguing ideas. You're arguing personalities.

>Instead, he
> slams around like a loose cannon chasing a bull in a china shop, and somewhere
> along the way, someone is gonna take potshots at him. Ite's inevitable, as long

And they see you the same way - a bull in a logical china shop.

> > What kind of response do you expect
> > to receive to your ideas when you expend so much verbiage calling people
> > names?

> I'll say it one more time- I turned the other cheek and it got whacked right
> off, and I'm tired of it. Don't to that anymore.

Then apparently all what you want out of this is to throw insults back and forth.
Cuz that's all it's ever going to be. It's what you make of it.

> You find a way to call off the dogs, and I'll be pleased to stop stomping 'em.

How can someone call off the dogs when you keep throwing meat at them?

> I think you misread the term as it was not intended to be derogatory,
rather as
> an abbreviation. Even the geeks of today call themselves geeks. It's
language in
> transition. I used 'techies' to keep from having to use half a sentence to
> otherwise describe them.

Actually, you used 'tired old refrains' to describe them.

> So when they feel like being called assholes, all they gotta do
> is provoke me, right?

Yep. And then you procede to make an even bigger one out of yourself. You
really showed them, right?

> So what they claim is so much vapor designed
> solely to make me angry? So why aren't they being called to task for it?

Because you repeatedly ask for it? Can you at least TRY to take some advice
about namecalling?

> Reality doesn't seem to mean much to them.

Because they call you names? It's the same thing you're doing. Is it
supposed to only be realistic when you do it?

> > Try editing out all the personal stuff before you send. You might find
> > you'll see less of it in their replies to you.

> Yep, just let the slams come on long enough and I imagine they will
> eventually believe their own nonsense.

So it's really all about you, then isn't it Dick. Not the issues. Or is it
about Morse code to the exclusion of all else. Because I don't see what
else you're bringing to the table.

The reason I listen to you, and your assessments, is because you've been a
ham a lot longer than I have. I know that you've seen a change in the way
things are on the air. But at the same time I know I have to filter out a
lot of the 'grouchy old guy who doesn't suffer fools gladly' parts - because
it's not just fools that old guys don't suffer gladly. They don't suffer
anything without grousing about it.

> And who knows about all the
> bewildered newcomers?

They're probably bewildered by all the beligerant namecalling, that's for
sure.

> Don't own a boat, Jim. I guess I'm getting a bit on the intolerant side
> in my old age. I just don't suffer fools and jackasses near so easily as
> I once did, even those who claim to be geniuses.

Well, I think they probably are pretty close to being geniuses. (The self-fulfilling part of genius, is that stupid people have trouble recognizing it.) That's why I try at least, to choose my words carefully when I post them. There's a pretty well above average group here in general. So when I make a stupid blunderous statement, chances are really good I'm going to hear about it. Best thing one can do is to avoid saying any more than necessary. It's easier to edit, if nothing else. Ever notice Cecil's posts? Very few words, but very carefully chosen ones....usually. One can only put ones foot in his mouth while it is open.

I would add that the 10-20 year lag time between exposure and incidence can be partially deduced by looking at people who have worked in similar RF exposure occupations for the past 40-50 years. This would include people who have worked in the mobile two-way radio fields, including public safety, and of course amateurs. In all the epidemological studies I've seen, there is a small but measureable increase in leukemia-like cancers, but not in malignant tumors. Though not conclusive by any means, it provides hopeful data that we are not building in 120 million cancer time bombs 20 years hence.

The world is full of small risks..... ham radio and cell phones are ones that I voluntarily choose to accept :_)

In a small way I would like to pronounce a plague on both your houses,
sort of like Dilbert's darning to Heck.

I am one of those who felt in 1975 or so that Morse over 12 was ridiculous
from a regulatory perspective and I can see no public purpose served by
requiring it now. At the same time when I see Morse become glandular,
Bert get trashed, and testicles get subbed for brains I begin to wonder if
it might not be a good, if unjustifiable, idea to keep it around even at 5
wpm to keep this collection of children at bay. For that is about what
NCI is -- a playpen rebellion comparable to the Revolt of the Sociology
Majors we called the 60s und I vas dere Sharlie. Had the hard sci, math,
engineering people been involved there wouldn't be a building standing but
apparently the rubble today would all have digital networks and MTV.

Like Dick I as well have been accused of being a mother raper, father
raper, and for reasons I cannot fathom am supposed to be impressed when
they move to the other side of the bench.
The more thoughtful, like Jim, who recognize that the change may be

necessary and try to make it sufficient are met with talk that sounds like some coaches and all cheerleaders' 'Fight, fight, fight.' Impress them with our prowess, do.

It is not the elimination of the Morse test but the entry of a real collection of spoiled brats that will doom the Amateur Service.

Dick N&#65533;BK

Well sad to say, Ham radio even for emergencies is becoming a thing of the past. Newer technologies are here and coming, that Federal, State and local emergency services are using, that can be setup and be on the air in minutes. I like CW, but I can't think of any scenario where it would be absolutly needed, abeit nuclear war, where someone needs it. (In which case I for one, am not going to hang a dipole in a tre and pound a key..;P) or your homebrewing a transmitter from scratch on a desert island to call for coffee. Again, not downing CW, I enjoy CW, just technology has changed so much with satellite, microwave, etc. I don't think even alot of newer people are interested in it as they were 20 years ago. I think CW will be here as long as there is ham radio if nothing else than tradition. But there is a different people today coming in expecting different things like satellite, microwave, computer radio interface, etc. Not that thats bad, just times change.. Even homebrewing is becoming more of a "specialty". Mass production made alot of stuff in ham radio cheaper to buy than make. I personally like to make as much of my gear that I can. Also like to restore old receivers and transmitters, but the guys who do it are getting fewer. Lots of the old Elmers are SK or too old to teach anymore. For guys just coming in the hobby and even for guys like myself, you could learn alot from the old timers but not enough people are learning to take the place of the ones gone. I mostly grew up just when the old tube gear was going to solid state so right off I was handicapped with the old stuff not knowing anything or finding anyone that knew anyting about it. Most of the new gear is "Plug and Pray", fry a board you throw it out and get a new one, never understanding how it works.. I read my butt off on every book I could find. I really believe I would be much more knowledagble if I had some experienced Elmers around to show me some things. But I did ok considering I was learning a technology that most guys had forgotten. (probably alot of you guys were in the same boat..) I think mass production of gear and the loss of good Elmers have seriously crippled new people as far as learning. Shame really. Nothing like firing up an old rig and making a contact or hearing a station on a radio you repaired or made yourself. The thrill of something you made or repaired is something that few hams experience today. This is what I really think is missing today. Enough ranting..Thanks for reading..

>In all the epidemological studies I've seen, there is a small but measureable
>increase in leukemia-like cancers, but not in malignant tumors.

The Milham study was one of the more famous (infamous?) ones involving Amateur Radio. In it, Dr Milham found a slight increase in two rare forms of leukemia. One factor not often mentioned is that the average age of death of the hams studied was greater than the median for the population as a whole. :-) I have not analyzed the confounding factors that might account for this, just offer it as food for thought. (Examples might be the socio-economic class of the hams compared to the general population, the fact that ham do not start ham radio at birth, but the average age of death includes those who die very young, etc.)

>The world is full of small risks..... ham radio and cell phones are ones
>that I voluntarily choose to accept :_)

One other thing to put into perspective -- the specific-absorbtion rate (SAR) permitted to any small amount of tissue from a cell phone is 1.6 W/kg, if memory serves. The SAR that applies to whole-body exposure, such as occurs from most Amateur Radio operation is 0.08 W/kg. FWIW.

See http://www.arrl.org/rfsafety for some information and links.

The very fine micro print embedded in the security markings of the FCC certificate states that the privileges were only good and current if the test was taken on the 3rd-odd Wed in a week of the even numbered month during the odd -off calendar leap year, during a non-millennium decade.

Such operations may commence if operator is able to show "good faith" operating practice and enhanced skill levels using a battery powered code oscillator that uses it's "exciter circuit" to start the washing machine in the gentle mode all the while making the toilet flush and the doorbell ring simultaneously.

I could go on & on clarifying additional micro embedded fine prints from the FCC but I must go now, the ice maker on my refrigerator wishes to go "online" now to request groceries. :-)

> Well, there you have it.

There you have what? That he wants to see just as many hams experimenting with digital radio as there were hams experimenting with SSB in the 50s? Why is that a "there you have it" sort of thing to you?

> You don't even know what you're saying.

I think that it is your interpretation of what he is saying that is somewhat at question here, Dick.

>Your "experimenting" is all done with digital theory and writing software,
>forget actually putting a rig on the air (save for your 'favorite' mode, CW).

He offered DSP as one easy way that hams could experiment with digital modes. Just how did YOU do PSK-31, Hellschreiber and the other modes you claim to have operated without using digital signal processing software written by others?

Are you really faulting Cecil for wanting hams to experiment with DSP to easily implement digital techniques while you are using the DSP software for soundcards written by others to do your own experimentation?

Is this another "do as I say, not as I do" sort of things?

> Mine is USING digital modes on the air to compare and see what each will
> actually do in various condions.

Using DSP software written by others, no less.

>Probably the clearest demonstration of our differences goes back the flap
>over PSK31 where I could copy the CWID but not the PSK on that group of
> weaksignal Europeans on a near-dead 20 meter band.

>You said one must compare modes in a 31 hz bandpass and I said nonsense, in
>an
>operational situation you compare under the conditions you use. Theory vs
>practice.

I agree. All modes, from OOK CW to any digital mode, have their limitations. With PSK-31, one limitation is that the sudden phase shifts that can occur during unstable ionospheric conditions throw it for a loop. I would say that a "dead band" probably qualifies.

> Looks like you're out of luck Cecil.

OTOH, you think that Cecil proposing that hams experiment with improving the software you use to decode PSK 31 makes him "out of luck."

I just can't follow the logic here, Dick. I really can't.

> So what in the world makes you think the ARS would "benefit" from every ham
>designing his own discrete digital mode?
Where did he say THAT? Man, you can read anything into anything. He said:

>>Speaking for me, I would like to see as many present day hams experimenting
>> with digital modes as there were hams experimenting with SSB in the early
>> 1950's.

How did you get "every ham should be designing new digital modes" out of that?

No wonder you are always so mad at what you think other people say!

>How many more would you like to add, or more to the point, how much
>dissipation do we
>need? No, I don't advocate stopping where we are. I DO advocate that new
>digital mode
>development will NOT be enhanced by each novice digidesigner flooding the ARS
>with
>his own novice output. After all, we have the likes of Peter Martinez working
>for us.

And I think that with a number of hams (note, please -- I did not say EVERYBODY) working on improving existing modes or even developing new ones, Amateur Radio will develop improvements. Why would you possibly not want to see this happen? We already have rules that require that the modulation method be legal on the frequency in use and the encoding method be public.

> Sure, lots of hams who can find LOTS of time and have the aptitude to learn
>the basics of DSP might benefit marginally from time spent with a
> evaluation board. LOTS of time.

Sure, good things sometimes do take lots of time. I spent lots of time learning antenna modeling -- I learned a lot in the process. I spent a lot more time learning about RFI -- I think we can safely say that Amateur Radio benefitted from that. Why do you feel that a ham who learns DSP will benefit only "marginally?"

> But wait- they didn't have time to learn Morse code, which would
>take far less than learning DSP.

It really IS all about Morse code for you, isn't it?

There are probably more hams experimenting with digital modes today
than there were on SSB in the early '50s.

>There's almost no hardware design expertise necessary to buy a DSP
>eval board and get to experimenting.

Software is another matter, though.

With SSB, the result was standardized and the development was in how to get
the desired result. Not true with the modes you're describing.

No, that's not quite right, Larry.

The 57% majority was not just hams' opinions - it came from ALL who commented. Of course most who commented were hams, but many were not, and all parties are invited to comment.

>just IMHO, that's a natural fact.

Nah, it's a lot simpler than that. Rewind back to 1990...

FCC isn't enamored of code testing for a variety of reasons. They've been pushing
for a nocodetest license since 1975, they dropped the sending test, and still they
encounter all sorts of opposition to lowering standards. The White House calls and
wants to know what's what about the code test and why one of our few friends in
the Middle East is making a big deal of it.

FCC folks know they can't get around the treaty thing, so they do the next-best and
create a bandaid solution that makes the White House happy. End of story.

Remember that Papa Bush & Co. had a vested interest in eliminating the RO
requirement on commercial vessels like oil tankers, too.
>

>>
>>73 de Jim, N2EY
>
>Sort of like, "If you can't beat 'em, let 'em join -- then work on them
>from the inside out.

Bingo.

>Funny, that concept would never have occurred
>to me.

It took me a long time to cotton on to it. But does it not make perfect sense? The
person with a license has expended some resources to get it, has agreed to play
by the rules, and most of all has told Referee Riley exactly who he/she is, and

where he/she can be found. Compare this to the anonymous unlicensed pirate.

So every comment that said "it'll let the cb types in!!" told the FCC that they were
on the right track.

Somebody once said that the easiest and most effective way to change somebody
from liberal to conservative is to give them a decent job, a mortgage, car payments
and a couple of kids. Same principle applies.

>Once again, IMHO, that sounds like a lazy man's way out.

Big part of the game is saving FCC resources.

I'd bet that in nearly every idea that becomes a tangible thing, there is a person who only had the conceptualization of it ever being reality. For those who cannot read and speak proper English, what that means is: a designer puts ideas on paper that builders use. A research scientist comes up with procedural operations that surgeons experiment with and perfect.

There are thinkers, there are doers. There are teachers and there are the learned. This world cannot survive without both. Few people are both.

Kim W5TIT

Let me see if I get this straight.

The FCC created both the tech and Novice, each with a 5 wpm
test element. That was some 50 years ago. In that time, the
issue of the validity of 5 wpm meeting the treaty requirements
has never been raised by anyone...and it is your opinion then that
the 50 years of unchallenged history doesn't
constitute sufficient proof as to the validity of 5 wpm
meeting the treaty?

It's logical for a person to start out experimenting with filters,
CW filters, SSB filters, etc. Designing software to decode CW or
FSK is challenging and doesn't require a new mode.

Fact is, it's not so much the loss of the Morse qualification that is so damaging as is the attitude of those who so heartily applaude its departure; for they show clearly an attitude very much foreign to that so long displayed by most participants in ham radio, that is, whatever job is to be done one just goes ahead and gets it done.
Those very same spoiled children displaying their childishness.
Adults just don't act like that.

I don't know, but that was one of the big snags cited when the company went bust and the primary reason no one was in a hurry to buy it out. Evidently someone eventually did, if it wasn't all dumped into the ocean as was iminent at one time. Seems like the government may have taken it over.

Not to worry, Ed. With the proliferation of nonsense witnin the ARS Dale Hatfield's "warning shot" will have proved to be more prophetic than anything else. By the time FCC will need to gather the evidence needed to yank assignments to sell to other services, we will have provided far more than they need. I feel rather sure that those who covet our spectrum have every confidence it will go that way, based on nothing more than what they can monitor on the air-on SSB and FM, of course.

> And Dale Hatfield's speech seems to imply that enough hams who don't need no
> steenkin' new technology and it's all over.

Well the only hams who "need" any new technology, steenkin' or not, are the Moores and Stevensons who are driven by it, and of course made a career of fully immersing themselves in it. The rest of us are just along for the ride. We pick it up as it becomes attractive to us, and become users, as time passes and utility and usefullness of the modes show themselves - just as it has always happened.

Din't say it did. But nothing can change the fact that anyone who passed
his Extra exam after the restructuring is less qualified than before.

I know what you're talking about obviously you still don't know what I am.
I've worked a lot of weak DX on "dead" bands. Even 6 meters. The point is
hams are often way too quick to declare a band
"dead".

Just the opposite, Bill. Sorry if I wasn't clear.

The last point I was making is that even if we discount the Novice as
proof of 5 wpm, the Tech proves the point handily. The Tech has always
been a permanent renewable license.

From: kelly@dvol.com (Brian Kelly)

>Don't bet on that. This thing is another techie brainfart whose time
>will never come.

I think eQSLing it will indeed happen, Brian, but it will not replace the paper card. If a DXpedition wants to issue paper cards, they will do so, and I bet hams will work them. If a DXpedition wants to avoid the hassle of paper cards and just upload their logs, they will do so, and I bet hams will work them.

But eQSL will not supplant paper QSLs for decades to come, I imagine. Just think of the uproar if ARRL were to decide not to accept paper cards from North Korea, and they chose to QSL only via paper. We may see an e-only award or two, but the mainstream awards will accept either paper or electronic QSLs.

It will all be a matter of choice. The DXpeditions do what they want, and the hams on the other end choose whether they want to work them. Some few may choose not to work a station that won't issue a paper card, but that will be a choice that makes the pileup a tiny bit smaller, increasing my odds just a bit. :-)

I don't know of anyone who was issued an FCC license without meeting the requirements. Do you?

I would imagine that most of the people who have upgraded since restructuring neither whined, ranted nor spoiled Amateur Radio by doing so.

Would you characterize the post you just made calling people you don't know "spoiled brats" a whine or a rant? To tie it in with another post, do you think it is adult to call people you don't know "spoiled brats?"

Just curious whether you have one standard -- or one for yourself and a different standard for others.

>It's logical for a person to start out experimenting with filters,
>CW filters, SSB filters, etc. Designing software to decode CW or
>FSK is challenging and doesn't require a new mode.

But designing software to decode existing modes could design better ways to do it.

As DSP gets higher into the RF region, it will become easier to use this faster technology to do things that can hardly be imagined. Just as an example with OOK CW, at 100 kHz IF, very doable with existing, affordable DSP technology, each dit at 20 wpm would have about 60 ms duration. In that 60 ms, there would be 6000 cycles. Although there is not necessarily coherence between a dit and the next, it should be possible to find the coherence in 6000 cycles of IF and thus, by finding the coherence then going back and looking at the entire element again, do coherent-CW detection on a dit-by-dit basis.

And when DSP gets to 30 MHz and 32 bits, it will be possible to do so at RF with dynamic range approaching useful (~96 dB). It is more likely, however, that any such DSP radio will use a combination of analog and digital techniques.

Don't scrap your ARES nets just yet. If 9-11 is any indication the reverse may be true, at least for a while. Many agencies had come to rely on cell phones (some had even scrapped their radios) only to find the cell net hopelessly jammed when everybody and their dog tried to use it at once. That's why officials are scrambling to change the system so they can cut off "non-essential users" (ie, us); but the telcos are saying "prohibitively expensive".

How am I less qualified now as an Extra than before restructuring
as an Advanced? What qualifications did I suddenly lose by becoming
an Extra? This effect you describe could be devastating because I
am not aware of any loss of qualifications.

Coherent CW (CCW) based on a fixed baud rate would be one hell of a mode
and would run circles around all but the most sophisticated modes that
hams use today.

> And when DSP gets to 30 MHz and 32 bits, it will be possible to do so at RF

I drove up to Texas Towers yesterday and got me an IC-756pro. I played with
it last night and it has 32 bit processing power. Amazing stuff. The Clear
Speech audio system performs miracles according to some users. All this DSP
stuff was done by programmers. The present state of the art in radio includes
software as well as hardware. Promoting the state of the art is one of the
basis and purposes of amateur radio.

But back in the 50's if I remember correctly, Tech's weren't allowed on HF.
Therefore, they did not fall under ï¿½25.5.

I'm not sure that's a true statement, Dick. In any 80 year life span, there's
a good chance that a person has benefited from emergency communications even
if indirectly. If emergency communications benefits my cousin in Louisiana,
then I indirectly benefit from it. In fact, it would be safe to surmise
that all citizens of the US benefit from emergency communications even if
only indirectly. Emergency communications promotes the general welfare.

No you have not! It is impossible to work anyone on a dead band. If you
can work someone, the band if not dead. Why is that so hard to understand?
If you think the band is dead and you work someone on it, you were mistaken
about the band being dead. Your inability to hear any signals does not
prove a band is dead. Your thoughts do not cause reality.

Thanks, Ed.

But I would submit that the FCC saw the medical waiver situation as a band-aid that they wanted to get rid of. Even if their review was not extensive, it was a lot of admin work. Same reason to simplify the license structure applies.

Under the old system, a new ham could go through 6 steps from no-license to Extra, each one requiring FCC action (initial license, four upgrades, medical waiver). Under the new system there are only 3 possible steps - half the old total. In the short term, the new system has produced lots of upgrades but in the longer term it means much less admin work for the FCC. And that may be a very good thing in the longer term IF less admin means more enforcement.

Go Riley!

I have a question. There seems to be some question about verifying QSL
cards. If I print out a QSL card on my printer and mail it to someone,
what is the difference in emailing the .jpg file and having the ham
on the receiving end print it out? The printout is the same either way.

I have to agree with you. I am a new ham, probably on the younger end of the curve, manage
an emerging technology and am heavily involved in new cutting edge technology. But, in
this area, I agree physical, hand-signed cards are superior to eQSLs; at least for me anyway.
Not being a fan of eQSL doesn't make one a Luddite.

Dick:

You're talking about only one thing here. The Morse code test is what kept the spoiled brats *out* of the ARS, for the most part. I say "for the most part" because there are always the code-tested-but-politically-correct types who sided with the no-coders in order to avoid the social disenfranchisement that usually comes when you dare to suggest that someone actually make an effort to learn a useful communications skill.

The NCTA is all about laziness -- it's never been about anything else. The current crop of "newcomers" to the ARS are at an all-time low in technical involvement, in spite of the fact that there is virtually nothing left WRT code testing. Pretty soon, a "technically competent" ham will be defined as one who can successfully get his off-the-shelf HF rig on-the-air (using SSB, of course) without the assistance of more than a half-dozen "Elmers." Whoopie!

Even though the VEs handled all the paperwork, just dealing with all the complaints about abuses was reason enough for FCC to decide to drop code speeds enough to get rid of it.

I'm still working on the "standardization" of SSB.

How in the heck does one "standardize" SSB other than an arbitrary choice of sideband on frequency?!?

There's no variability on AM other than government regulations stating a maximum spectral occupancy on a signal. With FM and PM there can be a wide latitude of modulation index and thus spectral occupancy... which requires a receiving bandwidth, possible modulation frequency "equalization," etc. SSB is AM with only one sideband group and the carrier suppressed.

It must be buzzphrase time; "there was STANDARDIZED SSB!" :-)

With kind but curious regards,
Len

>
>But consider the indirect benefit. Do you know someone who is of value
>to you who has benefited from emergency communications? I do.

Do you consider 4 to 5 million people *IN* an earthquake as applicable
to this "emergency communications" discussion? Every one of my
neighbors were IN such a widespread emergency eight years ago. The
Part 90 Public Safety Radio Services, even a few PLMRS radios were
on the job working to aid communications. Immediately. They were
equipped and trained for that sort of thing. Total electrical power
failure over a huge area for many hours. Where was all the vaunted
ham emergency communications? Were they even needed if they
got on the air? [unknown since all that's been published has been
some generalizations and general proselyting phraseology]

I realize that some emergency situations in certain geographical areas
aren't counted as such. It wasn't in anybody's back yard, was it?
Not a hurricane with dramatic period of warnings, announcements,
and activations to build up to an anticlimax. It didn't happen on the
Center of the US Universe which God located on the east coast where
the *IMPORTANT* things happen. It just happened. Suddenly. It
only killed 53 immediately, another 4 dying shortly after the first
shaking. The injured and the damage was all taken care of using
the established public safety and utilties infrastructure communications.

That's apparently unimportant to what some in this country IMAGINE
is involved in "emergency communications." Understood. NIMBY to
most everyone else. Five million people only count if they are located
in an "important" region of the USA where all the "right-thinking" folks
are.

Still waiting for an Official ARRL Radiogram message to arrive here.
So are my neighbors, friends, and acquaintences. Is there a paper

shortage on Official message forms?

With kind regards,
Len

Sure. Stevenson and Moore, for two. Of course that assumes the requirements they WANTED to license under, but just never could cut the mustard. So they hung around wailing and moaning until all the incessant whining got the requirements dropped to their level.

The DoD is paying a $3 million/month phone bill now, so that is probably covering the basics. That the DoD also took the trouble to build their own private ground terminal in Hawaii suggests that they seriously like this service. Between that sugar daddy and the fact that the new owners have only a $25 million investment to get return on, rather than the billions that were written off in bankruptcy, the service has gotten pretty cheap relatively speaking. The per-minute rates seem to now be as good as I pay for international GSM roaming.

Of course the other effect has been to drive their competitor Globalstar to the brink. And I see Teledesic has scaled back their yet-to-launch LEO constellation from nearly 600 satellites originally and 288 satellites 5 years ago down to 30 now. It seems that LEO satellite service is a solution which still has a limited problem space.

How much of the programming in that rig was done by hams as amateurs? How
much reprogramming of that rig will you do, Cecil?

That is correct.

>Therefore, they did not fall under ï¿½25.5.

That is not correct.

S25.5 actually says that ALL amateurs must be code tested. Later amendments added exceptions. At first the exception was for hams whose licenses were only for the bands above 1000 MHz. The amendment limit has since been lowered to 30 MHz.

'50s and '60s Techs had to be code tested to meet the treaty because their privileges extended below the limit then set by the amendments.

Nope, it doesn't, Dick. The citizens who do find themselves in the widespread emergencies have loved ones all across the country who benefit indirectly from those emergency communications. I'll bet the majority of citizens have benefited either directly or indirectly from emergency communications.

This is obviously hearsay, but I heard that a good percentage of ICOM RF
designers are hams. My development tools cannot match a 24 bit A/D and
32 bit processing power but I learn a lot by experimenting with my DSP
eval board. It's a Motorola DSP eval board that is presently pretty
much obsolete by now but simply observing its limitations gives me an
idea of how the 24/32 bit stuff operates.

In summary ...

1... for a period of time after April 15, 2000 [known as Black Thursday by some] if you held a pre-Mar 21, 1987, Tech Plus, you could gather the paperwork and have the VE certify that to the FCC, resulting in a General. That license required Element 1 (5wpm) and Element 3 (the current General). I thought that opportunity expired with the 2001 rewrite of Element 3 -- but not sure?

2... if you hold a pre-Feb 14, 1991, Technical license or a post-Feb 14, 1991, through Apr 15, 2000, Technician Plus license, you are classified as Technician Plus until you upgrade or allow the license to expire beyond the grace period;
your Element 1 can be applied toward the General license when Element 3 is passed.

3... if you passed the 5wpm after Apr 15, 2000, the Element 1 CSCE is valid for upgrade to General for 365 days, during which time you either need to pass Element 3 or ...

4... if you passed the 5wpm after Apr 15, 2001, the CSCE grants the Novice/Tech Plus operating privileges for as long as you hold the license; however, you will be classified as Technician, not Technician Plus.

5... if you passed the 5wpm after Apr 15, 2000, and Element 3 within 365 days to earn General, I believe you may test for Extra based on holding General, not on the Element 1 CSCE?

No difference as far as I can see. As a fairly new ham, I was flabbergasted by the Bureau approach to qsl'ing. Seemed like a huge amount of hassle. I might even get involved in DXCC and other stuff like that now that the QSL walls are coming down.

I know there is inertia to overcome, but it is hard to deny that eqsl's are superior in all ways but one, and that is the niceness of receiving a card from far away places.

True enough, Steve. But how often are those original signatures ever
verified? It's probably easier to verify that email was sent to you by
someone than trying to verify a signature from halfway around the world.

There is a nice touch in recieving a QSL from someone from far away.
But if the ham uses a bureau, then there isn't even that.

I think the only real losers in this are the people who print QSL's for profit.

Often enough. On my first application for DXCC, they were unable to
determine if one card was valid or not (I'd had it 10 years and it was faded).

Also, my best friend, who is VERY active in DXCC, has had cards retruned
for various administrative reasons.

>There is a nice touch in recieving a QSL from someone from far away.
>But if the ham uses a bureau, then there isn't even that.

Why? I get lot's of cards via the bureau that have personal notes
attached...even if it's just "TNX QSO ES 73". I don't care that they arrive in
seperate envleopes.

>I think the only real losers in this are the people who print QSL's for

I think you misunderstand, Ed.

With SSB, the standardized result was an amplitude-modulated voice signal
with the carrier and one sideband attenuated. Such a signal can be generated
and demodulated several ways, but all are compatible. Hams did not just
"duplicate what had gone before".

With "new modes and technology", the problem is a growing proliferation
of digital modes that are incompatible. Digital tower of babel and all that.
Limits the appeal of new modes.

> IMHO, this would
> have Amateur Radio adding to the state of the radio art.

Of course - a good thing.

But there's a slight semantic change there, Ed. The usual phrase is
"advancing the state of the art" which is usually defined as pushing
things "forward" in some way or another. For example, SSB voice is
an advance over DSB voice for communications purposes because it uses
less spectrum and delivers better S/N for the same power level.

How does one define "adding to the state of the art"? Seems to me it
would mean anything that hadn't been done exactly the same way before.
By that definition, any new design that is not an exact copy of a
previous one adds to the state of the art.

Works for me!

Hundt's assigned mission did not include trying to be
popular. You either followed his orders or got out of the way.
It was not your job to like his policies, just carry out his orders
or leave. Civilians always have a difficult time grasping this simple
concept. Hundt carried out the orders of his superiors with
aplomb. Mission completed, he returned to private pursuits. Not
all the difficult to understand, is it? You ought to read his latest
book, not too badly written, even for a liberal Democrat.

Best of Luck & Good Luck in The Contest,

Bob

Obviously a rhetorical question. Are you saying that just because I
cannot reprogram my store bought rig, that I should forget about
experimenting? I'm surprised.

Additionally, people can be helped indirectly simply
because hams have helped provide local assessments
as to road conditions, travel problems, etc. The
public may have no idea that a news advisory in
any way involved hams.

I don't sign my QSL cards. The only difference between the QSL
cards that I snailmail and the ones that I email are the postmarks.

Jim is right. Does anyone recall when the exception went to 1000 MHz
and then lowered further to 30 MHz?

Cheers,

What exactly is the attitude you claim is being exhibited?

> Those very same spoiled children displaying their childishness.

When the code issue became a form of battle, why is it "childish"
for the winning side to exhibit joy in the outcome?

> Adults just don't act like that.

Let's see:
Superbowl parties,
election parties,
end of prohibition,
Desert Storm celebration,
end of 55mph national limit,
etc.
